Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

THIS PAGE INTENTIONALLY LEFT BLANK

Appendix E

Parking & Trip Generation Information

THIS PAGE INTENTIONALLY LEFT BLANK

Land Use: 610 Hospital

Land Use Description

A hospital is a facility that provides medical, surgical care and overnight accommodations for patients who need medical care and surgery. However, the term "hospital" does not refer to medical clinics (clinics) that provide diagnostic and treatment (care only) services limited to the care of people unable to care for themselves), which are covered elsewhere in this report. Surgery center (Land Use 310) and clinic (Land Use 300) are also used.

Database Description

The database included 176 study sites, 144 inpatient and 32 outpatient. Parking demand data collected from these sites and related details were analyzed separately.

- Average hospital size: 64,000 sq. ft. (GFA) (eight study sites); Average number of daily patients: 400 (12 study sites); Average number of daily patients per 100 sq. ft. (sq. study sites); Average number of staff per daily patient: 0.15 (seven study sites). These statistics apply to sites from all area types.
- Average parking supply: 4.7 spaces per 100 sq. ft. (sq. study sites); and 0.12 spaces per employee (24 study sites). The table below presents comparative statistics on study sites, weighted by area type.

Site Data	Forest	Suburban	Urban
Parking supply per bed	4.9 (7 sites)	5.5 (23 sites)	4.1 (17 sites)
Parking supply per employee	0.05 (4 sites)	0.09 (14 sites)	0.12 (10 sites)

Even though the ability to vary site characteristics was not fully realized in the database, the data show that some sites may not fit parking generation models as well as others. Inpatient hospitals, which appear to be located in a mix of area types and are larger than the database as a whole, generally provide more services and tend to be located in general average parking centers. Located in the strongest area type makes inpatient hospitals less likely to be located in general average parking centers. This may be related to a higher number of employees and higher care needs, and a higher medical services mix. The ability to vary site characteristics may be related to the higher parking demand per employee compared to the trend of other hospitals.

Given that the study sites charge fees for parking, daily parking fees ranged between \$2.00 and \$5.00. The average peak period parking demand at these study sites was substantially less than that observed for the overall hospital category. However, based on the small number of observations and the possibility that additional hospitals in the database charged for parking (which do not clearly indicate whether this charge is for on-street or off-street parking), the development of a strong demand rate indicator for parking could not be derived.

Land Use: 610 Hospital

The following table presents the time of day distribution of parking demand for all facilities in the estimated, totalized, 24-hour period table.

Facility Type/Number Days	24-Hour Day	
	Peak Hour (Peak Period)	Volume in Peak Period
1700-4200 sq ft		5
5:00 a.m.	11	3
6:00 a.m.	15	5
7:00 a.m.	11	10
8:00 a.m.	11	14
9:00 a.m.	42	48
10:00 a.m.	10	41
11:00 a.m.	38	46
12:00 p.m.	41	37
1:00 p.m.	128	48
2:00 p.m.	4	25
3:00 p.m.	27	11
4:00 p.m.	72	32
5:00 p.m.	44	17
6:00 p.m.	20	9
7:00 p.m.	13	8
8:00 p.m.	22	7
9:00 p.m.	11	1
10:00 p.m.	12	1
11:00 p.m.	14	1

Future parking demand data collection should include additional potential variables (such as 1,000 sq. ft. GFA, doctors, occupied beds and daily patient visits) as well as those currently plotted.

Weekday Urban Peak Period Parking Demand

Land Use: 720 Medical-Dental Office Building

Land Use Description

A medical-dental office building is a facility that provides illnesses and treatment care on a routine basis, but is unable to provide professional in-house medical and surgical care. One or more private physicians or dentists generally provide this type of facility. Clinic (land use 833) is a related use.

Database Description

The database consisted of a mix of urban and suburban sites. Parking data from sites at the suburban sites were similar to those at urban sites and therefore the data were combined and analyzed together.

• Average car occupancy rate: 1.9 spaces per 1,000 sq ft (0.5 ft² per 111 sq ft office area)

The two study sites with weekend parking demand in weekend had Saturday peak demand rates 10 and 20 percent less than the weekday peak demand rates for the same study sites.

The following table presents the time-of-day distribution of parking demands, based on data from sites with private five level surface bonded parking lots.

Hourly Volume per 1,000 sq ft (ft ²)	Weekday Data	
	Number of Peak Periods*	Number of Data Points
12:00-1:00 p.m.	—	0
1:00-2:00 p.m.	—	1
2:00-3:00 p.m.	—	3
3:00-4:00 p.m.	—	2
4:00-5:00 p.m.	—	5
5:00-6:00 p.m.	34	7
6:00-7:00 p.m.	131	8
7:00-8:00 p.m.	105	3
8:00-9:00 p.m.	59	2
9:00-10:00 p.m.	28	2
10:00-11:00 p.m.	20	1

Hospital Beds 373
 Hospital Employees 2,400

3rd Edition, ITE Parking Generation

ITE Land Use Code	Description	Unit	Urban Supply/ Unit	Urban Peak Demand/ Unit	Average Size	MVHS Unit	Urban Supply	Urban Peak Demand
610	Hospital	Beds	4	3.47	490	373	1,492	1,295
		Employees	0.72	0.6	2,400	2,400	1,728	1,440

parking generation data for hospital use by SF is not provided

ITE Land Use Code	Description	Unit	Supply/Unit	Urban	Average Size	MVHS Unit	Supply	Peak Demand
720	Medical-Dental Office	GFA (KSF)	3.9	3.53	43 KSF	80	312	283
		Fitted Curve Equation:		=3.49(KSF)-1				281

Data for medical-dental office buildings did not show a significant difference between urban/suburban sites

Summary

ITE Urban Location
 ITE Supply/Employee Rate = 0.72
 ITE Demand/Employee Rate = 0.6
 MVHS/MOB Supply = 2,040
 MVHS/MOB Demand = 1,723

Conclusions:
 - To be conservative, using the parking supply & demand estimates based on number of employees b/c it yields higher numbers than per bed
 - ITE estimate of needed parking supply is 2,040 spaces which includes spaces needed for the MOB
 - ITE estimate of daytime average peak parking demand is 1,723 spaces which includes hospital staff, visitors, and MOB

Land Use: 610 Hospital

Description

A hospital is any institution where medical or surgical care and overnight accommodations are provided to non-ambulatory and ambulatory patients. However, the term “hospital” does not refer to medical clinics (facilities that provide diagnoses and outpatient care only) or nursing homes (facilities devoted to the care of persons unable to care for themselves), which are covered elsewhere in this report. Clinic (Land Use 630) and free-standing emergency room (Land Use 650) are related uses.

Additional Data

Time-of-day distribution data for this land use are presented in Appendix A. For the four general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 7:30 and 8:30 a.m. and 12:00 and 1:00 p.m., respectively.

The average numbers of person trips per vehicle trip at the four general urban/suburban sites at which both person trip and vehicle trip data were collected were as follows:

- 1.60 during Weekday, Peak Hour of Adjacent Street Traffic, one hour between 7 and 9 a.m.
- 1.60 during Weekday, AM Peak Hour of Generator
- 1.72 during Weekday, Peak Hour of Adjacent Street Traffic, one hour between 4 and 6 p.m.
- 1.66 during Weekday, PM Peak Hour of Generator

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), California, New Jersey, New York, Pennsylvania, Texas, and Washington.

Specialized Land Use Data

A 2008 study provided data on a research hospital in Baltimore, Maryland (source 749). The trip generation characteristics of this site differed from sites included in this land use; therefore, trip generation information for this site is presented here and was excluded from the data plots. The site gross floor area is 2.8 million square feet and the number of employees is 5,500. The number of vehicle trips during the weekday, AM peak hour for adjacent street traffic was 1,168. The number of vehicle trips during the weekday, PM peak hour for adjacent street traffic was 1,080.

Total Project Trip Generation								
Weekday			AM Peak Hour			PM Peak Hour		
Entering	Exiting	Total	Entering	Exiting	Total	Entering	Exiting	Total
5,751	5,750	11,501	619	216	835	261	697	958

Notes:

The standard deviation for the weekday peak period data by number of beds was approximately 1, much higher than those for results based on employees or SF

Since estimates based on number of employees is more conservative than those based on SF, results based on number of employees was used in analysis

All estimates are based on fitted curve equation results

To be conservative and due to the high drive alone share for the area (83%), these trips will not be adjusted for mode share (transit, carpool, etc).

Attn: Mr. Paul Romano, P.E.

**Re: Trip Generation and Distribution Estimates – Proposed MVHS Hospital Facility
Oriskany Street, Utica, NY**

Dear Mr. Romano:

I have completed my preliminary review of the proposed MVHS development on Oriskany Street in Utica, NY, and have developed trip generation and distribution estimates for a typical weekday morning and evening peak hour. The following summarizes the work completed and methodology in developing these estimates.

These estimates have been revised per email comments received from NYSDOT on March 11th and 21st, 2016

Project Understanding

The proposed MVHS development is located on the south side of Oriskany Street (Route 5S), immediately east of State Street, with the primary facility extending east to Broadway and south to Columbia Street. Oriskany Street is Route 5S to the east of the Route 5/8/12 overpass and Route 5A to the west of the Route 5/8/12 overpass. The full build out of the development is anticipated to include a 930,000 SF hospital with a separate 80,000 SF physician's office building. The project will result in the closure of Lafayette Street between Broadway and State Street, and Cornelia Street between Oriskany Street and Columbia Street, however all other roadways will remain as they are today. Access to the site will be provided via connections to State Street, Broadway Street, and Columbia Street. There is an assumed limited access driveway to Oriskany Street opposite Cornelia Street as east/west left turns are not allowed at this location under existing conditions.

Aerial overlay images showing the location of the development and parking areas as well as primary access routes, provided by Hammes Company, have been attached.

Trip Generation Estimate

The proposed MVHS development includes a 930,000 SF hospital and an 80,000 SF separate physician's office building. The hospital is expected to employ a total of 3,645 people between the various shifts, including full and part-time positions. Trips generated by the proposed development were estimated using the ITE Trip Generation, 9th Edition, which is the industry accepted standard for estimating traffic generated by new developments. Land Use 610 – Hospital and Land Use 720 – Medical/Dental Office Building were used. The trip generation estimates were prepared based on both the square footage of the hospital as well as the number of anticipated employees for comparison purposes. The following tables summarize the trip generation estimates prepared for the proposed MVHS development in Utica, NY.

Mr. Romano

Page 2 of 4

**Re: Trip Generation and Distribution Estimate – Proposed MVHS Hospital Facility
Oriskany Street, Utica, NY**

Trip Generation Summary – Using Hospital Square Footage

	Weekday Morning Peak		Weekday Evening Peak	
	Entering	Exiting	Entering	Exiting
Hospital – 930,000 SF	557	327	329	536
Medical Office Building – 80,000 SF	151	40	80	206
Total Trips Generated	708	367	409	742

Trip Generation Summary – Using Hospital Number of Employees

	Weekday Morning Peak		Weekday Evening Peak	
	Entering	Exiting	Entering	Exiting
Hospital – 930,000 SF	814	316	307	750
Medical Office Building – 80,000 SF	151	40	80	206
Total Trips Generated	965	356	387	956

The detailed trip generation calculations have been attached.

The more conservative trip generation estimate based on the number of employees was used to further evaluate the potential traffic volume increases on the adjacent streets in order to provide a worst case evaluation of potential impacts.

Trip Distribution

Hammes Company provided detailed data on staffing and patient origins by zip code in the region, which has been attached for reference. The data accounts for approximately 90% of the overall origins for staff and patients anticipated to use the new MVHS site on Oriskany Street. This data was adjusted proportionately to represent 100% of the traffic generated by each patients and employees, and then a weighted average was taken to estimate the total percentage of traffic that would be generated by the overall development to/from each zip code in the area.

The primary access routes to/from the development are the North-South Arterial (Routes 5/8/12) to the north and south, Oriskany Street to the east and west, and Genesee Street to the north and south. The following provides a summary of how traffic from each zip code was assumed to access the site via these primary routes:

Zip Code	Location	Origin-Dest. Percentage	Distribution
13501	East Utica	23.4%	30% Genesee NB to State, 25% Genesee NB to Columbia, 15% Route 5/8/12 NB, 10% John NB to Route 5S, 10% 2 nd NB to Route 5S, 10% Route 5S WB
13502	West Utica	19.7%	35% Genesee SB, 25% 5/8/12 NB, 20% 5/8/12 SB, 10% Genesee NB to State, 10% Route 5A WB
13413	New Hartford	8.5%	90% Route 5/8/12 NB, 10% Genesee NB to State
13440	Rome	7.7%	40% Route 69 to Route 5A EB, 40% Route 49 to Route 5/8/12 SB, 20% I-90 to Genesee SB
13323	Clinton	5.3%	100% Route 5/8/12 NB

Mr. Romano

**Re: Trip Generation and Distribution Estimate – Proposed MVHS Hospital Facility
 Oriskany Street, Utica, NY**

13357	Ilion	4.5%	90% Route 5S WB, 10% I-90 to Genesee SB
13492	Whitesboro	4.9%	90% Route 5A EB, 10% Route 840 to Route 5/8/12 NB
13350	Herkimer	3.5%	80% Route 5S WB, 20% I-90 to Genesee SB
13340	Frankfort	3.2%	90% Route 5S WB, 10% Route 5 to Genesee SB
13309	Boonville	1.9%	100% Route 5/8/12 SB
13403	Marcy	2.1%	100% Route 5/8/12 SB
13417	New York Mills	1.8%	50% Route 5/8/12 NB, 50% Route 5A EB
13365	Little Falls	1.7%	50% Route 5S WB, 30% Route 5 to Genesee SB, 20% I-90 to Genesee SB
13407	Mohawk	1.5%	80% Route 5S WB, 20% I-90 to Genesee SB
13456	Sauquoit	1.7%	100% Route 5/8/12 NB
13438	Remsen	1.6%	100% Route 5/8/12 SB
13424	Oriskany	1.3%	100% Route 5A EB
13421	Oneida	1.2%	70% Route 5A EB, 30% I-90 to Genesee SB
13480	Waterville	1.2%	100% Route 5/8/12 NB
13495	Yorkville	1.2%	100 % Route 5A EB
13491	West Winfield	1.0%	60% Route 5/8/12 NB, 40% Route 5S WB
13354	Holland Patent	1.1%	100% Route 5/8/12 SB

The attached “MVHS – Traffic Distribution Forecast – Primary Routes” provides an overall summary of the weighted percentages by zip code and resulting percentages of overall traffic generated expected to use each primary route.

Based on the calculations, 26.2% of the total trips generated are expected to travel to/from the south on Route 5/8/12, 19.1% is expected to travel to/from east on Route 5S (with 2.3% via John Street and 2.3% via 2nd Street), 15.9% is expected to travel to/from the south on Genesee Street, 13.7% is expected to travel to/from the west on Route 5A, 13.7% is expected to travel to/from the north on Route 5/8/12, and 11.4% is expected to travel to/from the north on Genesee Street.

Locally, traffic traveling to/from the north via Genesee Street is expected to use Columbia Street to access the site while traffic traveling to/from the south on Genesee Street is expected to be split with approximately 66% using State Street and 34% using Columbia Street to access the site. Traffic entering from the west via Route 5A is expected to be split with approximately 30% using Columbia Street (via the Varick Street ramp, 53% using State Street, 11% using the parking area opposite Cornelia Street and 10% using Broadway to access the site. Traffic exiting to the west via Route 5A is expected to be split with 80% using Broadway and 20% using Columbia Street to leave the site. Traffic entering from the north on Route 5/8/12 is expected to be split with 75% using State Street, 15% using the parking opposite Cornelia Street and 10% using Broadway. Traffic exiting to the north via Route 5/8/12 is expected to be split with 80% using State Street and 20% using Broadway to leave the site. Traffic traveling to/from the south via Route 5/8/12 is expected to be split with 60% using the Court Street interchange via State Street and 40% using the Oriskany Street interchange. The anticipated arrival/departure distribution of traffic for the proposed MVHS development is shown in the attached Figure 1.

The trips generated were distributed through the local intersections based on the arrival/departure distribution and are shown in the attached Figure 2 for the weekday morning peak hour and Figure 3 for the weekday evening peak hour.

**Preliminary Geotechnical
Review**

1.0 PRELIMINARY GEOTECHNICAL REVIEW

1.1 Resources and Summary

Historic test boring information¹ was assembled from outlying sources or projects nearly surrounding the hospital site and campus. No test boring information was discovered within any of the proposed building sites, thus for the purposes of this report, CME has interpolated the subsurface data across several city blocks. Many of the existing boring logs are of variable quality and relevance in respect to this project, contain incomplete or fragmented data, and use terms and nomenclature subject to misinterpretation.

The hospital campus site is situated in a fully urbanized area which lies in the geologic transition zone characterized by relatively deep, soft, plastic lowland soils in the north and by relatively shallow, firm, elastic hillside soils in the south. Mostly single-story with a few multi-story concrete masonry and steel framed buildings dominate the site. Single-story structures are chiefly founded on conventional footing foundations in overburden or Till and multi-story structures on deep foundations. Most buildings are slab-on-grade with few basements.

From a geotechnical perspective, the lowland stratigraphy poses greater difficulties, more severe limitations and higher building costs than the hillside stratigraphy.

1.2 Subsurface Conditions and Characterizations

The generalized subsurface profile is preliminarily interpreted as given below based on the historic data.

Approximate Depth Range (feet)	Approximate Thickness (feet)	Deposit Description/Characterization
0 to 10	0 to 10	Urban Fill , existing structures, miscellaneous materials, unsuitable soils, random materials and buried or remnant pre-existing topsoil horizon.
2 to 40	7 to 39	Natural Overburden soils consisting chiefly of silts and sands with minor proportions of gravel and clay are generally soft to medium compact. In the northern portion of the site, plastic clays, deposited as sediment from a pre-historic lake, intervenes. These clays are subject to compression and long-term consolidation (volume loss). Overburden soils generally exhibit low bearing capacity which may be limited by settlement tolerance.
12 to 44	0 to 6	Glacial Till is discontinuous across the project area and where present consists of a mixture of soils overridden by Glacier. Till is generally firm or compact and exhibits moderate bearing capacity. Till contains shale rock in areas.

¹ Historic Test Boring Logs were obtained from NYSDOT MUD Ph. 7 and Overhead Sign Projects, (2009-2012), the City Courthouse (1995), Utica Auditorium (2014), City Hall (1964), Utica National Insurance (2001) and Police Vehicle Maintenance Facility (2004) projects.

**MVHS New Hospital Site
CME Report No.: 9592.2**

Approximate Depth Range (feet)	Approximate Thickness (feet)	Deposit Description/Characterization
12 to 44	unknown	Utica Shale Bedrock is poor quality and exhibits moderate bearing capacity. The upper several feet of bedrock may exist as highly weathered rock exhibiting little structure and very poor quality and/or decomposed rock consisting of Residual Soil (i.e. silt and clay) and/or interlayered rock-like and soil-like materials. Utica Shale may exhibit expansive characteristics.

The historic groundwater observations indicate a hydraulic gradient oriented approximately northerly at 10 feet to 20 feet below existing grade. The groundwater table may be a confined aquifer in areas, and if the upper confining layer is removed or penetrated, artesian conditions may be exposed. At the City Courthouse, once the confining layer was removed to accommodate a Basement Level, groundwater flowed vertically upward inside parts of the sheeted excavation creating a quick-sand condition. At the City Hall Project, construction delays and difficult dewatering conditions were reported by the inspecting engineer during drilled pier foundation construction.

Boring logs at the New Court Facility report odors consistent with hazardous materials and/or petroleum products. Hazmat and petroleum product contamination of the soils may impart premium costs to disposal of removed materials and may prevent re-use of the soils as unclassified fill.

Bedrock is of the Utica Shale Formation, which is known to exhibit expansive characteristic, in areas, due to pyritic sulfur content. At the Stanley Theater (Southeast corner of Genesee and Hopper Street), a building addition slab on grade was reported to have heaved as much as one-half foot due to expansion of bedrock and shale-rich fill used under the slab. Bedrock is within 12 feet of grade at the Stanley.

The upper 2 feet to 4 feet of the Shale Bedrock is typically weathered and/or decomposed to soil-like materials where many borings were able to penetrate it using earth drilling tools, before practical refusal to penetration was achieved. Decomposed and highly weathered bedrock is unsuitable bearing material due to variability of composition.

Practical refusal in Shale Bedrock was achieved at about elevation 445 near the south line of City Hall, about elevation 395 near the corner of Oriskany at Washington, about elevation 365 near the corner of Oriskany at N-S Arterial, and about elevation 405 near Kennedy Plaza at State Street. Bedrock below practical refusal generally was not sampled or tested for strength or quality in the historic borings.

1.3 Preliminary Geotechnical Engineering Evaluation

The current Downtown Hospital Location Plan shows the four proposed structures (i.e. CUP, Hospital, MOB/ACC, and Parking Garage) located between Columbia and Oriskany Streets. Except for the CUP, the other three structures are planned to be multi-story buildings with relatively high gravity roads at foundation level. The CUP may house heavy equipment that may require special considerations for foundation support.

Historic borings along Oriskany Street indicate intervening strata of generally plastic, soft, compressible, lakebed sediments and natural organic deposits.

MVHS New Hospital Site
CME Report No.: 9592.2

It is CME's preliminary opinion that the foundations for the four proposed structures will consist of deep foundations bearing in competent bedrock, such as driven end-bearing Piles or Drilled Piers (DPs). DPs may rely on skin friction in bedrock or a combination of end-bearing plus skin friction to support the planned improvements.

The lowest level floor slabs may be either conventional reinforced concrete slab on grade or grade beam (structurally) supported reinforced concrete slab, depending on many factors including, but not limited to, subsurface conditions, elevation, depth of cut and/or fill, slab loading, flatness/levelness tolerances, floor finishes, and planned use. Lightly loaded floor slabs set below existing grade and below Urban Fill are more likely to be conventional slab on grade.

The lowest level slab elevation will likely be limited by the ground water table, as excavation and construction below the water table will be very expensive.

Bedrock expansive characteristic may be an important consideration in the vicinity of the MOB/ACC site. The boring records for the site just east of Broadway, indicate decomposed shale and Utica Shale Bedrock within 12 feet of pre-existing grade. Special laboratory testing and engagement of an expert in shale expansion and design in expansive material may be warranted.

A site-specific Foundation Engineering Investigation is recommended for each major structure and its site plan under the design development phase. The limited planning-level opinions and criteria presented herein are not intended to be satisfactory for design purposes.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/07/2016 has revealed that there are 3 SEMS sites within approximately 0.5 miles of the target property.

MOHAWK VALLEY OIL IN	WASHINGTON STREET	NE 1/4 - 1/2 (0.480 mi.)	AS214	748

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 7 RCRA-CESQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 05/17/2016 has revealed that there are 8 NY SHWS sites within approximately 1 mile of the target property.

NY VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the NY VAPOR REOPENED list, as provided by EDR, and dated 08/01/2015 has revealed that there are 4 NY VAPOR REOPENED sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 04/06/2016 has revealed that there is 1 NY SWF/LF site within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 05/17/2016 has revealed that there are 51 NY LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 39 NY UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 4 NY CBS AST sites within approximately 0.25 miles of the target property.

State and tribal Brownfields sites

NY ERP: In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a \$200 million Environmental Restoration or Brownfields Fund as part of the \$1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

A review of the NY ERP list, as provided by EDR, and dated 05/17/2016 has revealed that there are 5 NY ERP sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 05/17/2016 has revealed that there are 50 NY Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2015 has revealed that there are 27 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, has revealed that there is 1 US AIRS site within approximately 0.001 miles of the target property.

Database: US AIRS MINOR, Date of Government Version: 10/20/2015

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/20/2015 has revealed that there are 10

NY HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the NY HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 NY HSWDS site within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within

EXECUTIVE SUMMARY

approximately 1 mile of the target property.

MOHAWK VALLEY OIL IN	WASHINGTON STREET	NE 1/4 - 1/2 (0.474 mi.)	AS213	748
NIMO - HARBOR POINT	WASHINGTON STREET	NNE 1/2 - 1 (0.668 mi.)	218	759

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 13 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/13/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 01/06/2016	Telephone: 703-603-8704

Number of Days to Update: 135	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 03/07/2016	Source: EPA
Date Data Arrived at EDR: 04/05/2016	Telephone: 800-424-9346

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 12/09/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/02/2016	Telephone: (212) 637-3660
Date Made Active in Reports: 04/05/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 34	Next Scheduled EDR Contact: 10/17/2016

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 12/09/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/02/2016	Telephone: (212) 637-3660
Date Made Active in Reports: 04/05/2016	Last EDR Contact: 06/30/2016
Number of Days to Update: 34	Next Scheduled EDR Contact: 10/17/2016
	Data Release Frequency: Quarterly

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State and tribal voluntary cleanup sites**VCP: Voluntary Cleanup Agreements**

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a \$200 million Environmental Restoration or Brownfields Fund as part of the \$1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

HIST SPILLS: SPILLS Database

This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database. Department of Environmental Conservation.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300

Southwest Map: 5938535 UTICA WEST, NY
Version Date: 2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> ONEIDA, NY	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> UTICA EAST	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: URBAN LAND

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands

Source: Department of Environmental Conservation

Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Radon Test Results

Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

PROPOSED DOWNTOWN LOCATION
UTICA, NY 13502

COORDINATES

Latitude (North): 43.1035260 - 43° 6' 12.69"
Longitude (West): 75.2348650 - 75° 14' 5.51"
Universal Transverse Mercator: Zone 18
UTM X (Meters): 480888.2
UTM Y (Meters): 4772123.0
Elevation: 430 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 03/07/2016 has revealed that there are 3 SEMS sites within approximately 0.5 miles of the target property.

MOHAWK VALLEY OIL IN	WASHINGTON STREET	NE 1/4 - 1/2 (0.480 mi.)	AS214	748

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 7 RCRA-CESQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 05/17/2016 has revealed that there are 8 NY SHWS sites within approximately 1 mile of the target property.

NY VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the NY VAPOR REOPENED list, as provided by EDR, and dated 08/01/2015 has revealed that there are 4 NY VAPOR REOPENED sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 04/06/2016 has revealed that there is 1 NY SWF/LF site within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 05/17/2016 has revealed that there are 51 NY LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

NY UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the NY UST list, as provided by EDR, has revealed that there are 39 NY UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 4 NY CBS AST sites within approximately 0.25 miles of the target property.

State and tribal Brownfields sites

NY ERP: In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a \$200 million Environmental Restoration or Brownfields Fund as part of the \$1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

A review of the NY ERP list, as provided by EDR, and dated 05/17/2016 has revealed that there are 5 NY ERP sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 05/17/2016 has revealed that there are 50 NY Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2015 has revealed that there are 27 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, has revealed that there is 1 US AIRS site within approximately 0.001 miles of the target property.

Database: US AIRS MINOR, Date of Government Version: 10/20/2015

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 07/20/2015 has revealed that there are 10

NY HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the NY HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 NY HSWDS site within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within

EXECUTIVE SUMMARY

approximately 1 mile of the target property.

<u>Lower Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>

NIMO - HARBOR POINT	WASHINGTON STREET	NNE 1/2 - 1 (0.668 mi.)	218	759

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 13 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 DEC Memo: "Prior to Sept, 2004 data translation this spill Lead_DEC Field was JOHNSON 8/19/2005: JULY 2005 UST CLOSURE AND PRELIMINARY SITE INVESTIGATION REPORT. SOIL DISPOSAL RECEIPTS FOR 225.77 TONS AT ESMI, FORT EDWARD. 3 MONITORING WELLS, 10 SOIL BORINGS, 5 TEST PITS, SHOW ADDITIONAL CONTAMINATION OF SOILS AND GW ON SITE. REMEDIAL INVESTIGATION TO DELINEATE EXTENT AND POTENTIAL REMEDIAL ALTERNATIVES PROPOSED. DEC REPORT REVIEW LETTER SENT W/ RESPONSE DATE OF 9/23/05. 2/1/2007: DEC REVIEW LETTER OF REMEDIAL INVESTIGATION WORKPLAN WHICH WAS PREPARED BY GZA ENVIRONMENTAL AND DATED 12/20/2006. WORKPLAN APPROVED, WORK TO BEGIN BY 4/2/2007. (JD) 4/9/2008: DEC REVIEW LETTER OF REMEDIAL INVESTIGATION REPORT - EXTENT OF CONTAMINATION IN GROUNDWATER NOT PROVIDED. NEED FURTHER SUBSURFACE INVESTIGATION SOUTH OF SP-26/MW-6. IF SOURCE REMOVAL IS CHOSEN AND SIDEWALL MEETS RSCO - LONG TERM GW MONITORING MAY NOT BE NECESSARY. REPORT RECOMMENDS IN-SITU TREATMENT USING CHEMICAL OXIDANTS. GZA NEED TO PROVIDE LIST OF IN-SITU PROJECTS GZA HAS HAD SUCCESS WITH. NEED METHOD TO DETERMINE RADIUS OF INFLUENCE AND MASS BALANCE FOR TREATMENT. (JD) 5/9/2008: REVIEWED GZA WRITTEN RESPONSE TO DEC COMMENT LETTER OF 4/9/2008. GZA TO CONTACT DEC TO DISCUSS SOURCE REMOVAL OPTION, AS SALVATION ARMY HAS POSSIBLE PLANS TO REDEVELOP THE SITE. (JD) 3/20/2009: GZA GEOENVIRONMENTAL , INC. HAS RECOMMENDED SOURCE REMOVAL OPTION AND WILL BE DOING WORK IN 2009 CONSTRUCTION SEASON PER 1/29/09 LETTER. SENT FRANK VETERE LIST OF LOCAL CONTRACTORS - PROJECT WILL BE BID. (JD) 4/8/2009: DEC APPROVAL LETTER OF REMEDIAL ACTIVITIES WORK PLAN FOR EXCAVATION OF 4000-5000 TONS OF CONTAMINATED SOIL WITH OFF SITE DISPOSAL. WORK PLAN PREPARED BY GZA AND DATED 3/16/2009. (JD) 5/11/2010: REVIEWED TANK CLOSURE/SPILL CLEAN UP REPORT PREPARED BY GEOENVIRONMENTAL, INC. (GZA) AND DATED APRIL, 2010. GZA SUBCONTRACTED WITH ABSCOPE TO PERFORM THE REMEDIAL EXCAVATION. THREE PREVIOUSLY UNKNOWN UST'S WERE DISCOVERED DURING THIS PROJECT. THE UST'S WERE PUMPED, REMOVED CUT AND CLEANED. 20 CONFIRMATORY SOIL SAMPLES FROM THE SIDEWALLS AND BOTTOM WERE TAKEN AND 17 ANALYSIS MET TAGM RSCO SOIL GUIDANCE VALUES. SOILS WERE REMOVED TO THE MAXIMUM EXTENT PRACTICLE. SOIL DISPOSAL RECEIPTS FOR 9,589 TONS OF SOIL WERE RECEIVED. THE SOIL WAS DISPOSED OF AT THE ONTARIO COUNTY LANDFILL LOCATED IN STANLEY, NY. ADDITIONALLY, 17,500 GALLONS OF PETROLEUM IMPACTED GROUNDWATER WAS PUMPED, TREATED AND DISCHARGED, UNDER PERMIT, TO THE ONEIDA COUNTY WATER POLLUTION CONTROL PLANT LOCATED IN UTICA, NY. NO FURTHER ACTION NEEDED. (JD)"

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 DEC Memo: "Prior to Sept, 2004 data translation this spill Lead_DEC Field was

JOHNSON 03/07/2008: FILE REVIEW: 3K UST REMOVED IN MARCH 1997. 12-15 YARDS OF PETROLEUM IMPACTED SOIL EXCAVATED. POST EXCAVATION SOIL AND GROUNDWATER LAB RESULTS SLIGHTLY EXCEED CURRENT GUIDANCE VALUES. GWI RESULTS FROM SPILL #95-01598 (SAME SITE) INDICATE IMPACT TO GW IS MINIMAL. DISPOSAL RECEIPTS RECEIVED FOR 1,212 TONS OF PETROLEUM IMPACTED SOIL. PER GENE SANTA CROCE, THE 12-15 YARDS OF SOIL FROM THIS SPILL WAS COMBINED FOR DISPOSAL WITH THE PETROLEUM IMPACTED SOIL FROM SPILL #95-01598. THE MATERIAL WAS DISPOSED OF AT THE SENECA MEADOWS LANDFILL IN WATERLOO, NY. NO FURTHER ACTION REQUIRED. (SR) "

Remarks: "POSSIBLE TANK FAILURE, UNKNOWN AT THIS TIME WHERE THE GASOLINE CAME FROM - LOCAL DEC HAS THE TANK TEST REPORT FROM LAST YEAR AND DEC IS ON SCENE"

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Town: Utica (c)
Acres: 2.246
Record Added: 11/16/2005
Record Updated: 05/14/2013
Updated By: PRTAYLOR
Site Description:

Actual:
422 ft.

Location: The Potter Street Site is 2.246 acres in size and is located at 470 Whitesboro Street in Utica, Oneida County, New York. The site is bordered by the New York Susquehanna and Western Railroad maintenance facility to the north, the Route 12 arterial to the west, and the former Cosmopolitan Center building to the southeast. The Utica Harbor and Mohawk River are located approximately 0.25 miles north of the property. Site Features: The Cosmopolitan Center, which was a neighborhood recreational center, is located on the southwest corner of the site, otherwise the site is vacant and covered with a mix of concrete sidewalks, asphalt parking and vegetation. Current Zoning/Uses: The site is currently inactive, and is zoned for multifamily residential use. The surrounding parcels are currently vacant or used for a combination of commercial, public recreation and light industrial. Historic Uses: The site has been developed and occupied with various commercial or light industrial facilities since 1884. The northwest portion of the site was occupied by a tannery, a button factory and a machine shop. The 1925 Sanborn Fire Insurance Map shows that the southern portion of the site was used by the Sitrin Brothers Auto Exchange. Auto reclamation continued until 1960 when the associated structures were demolished and the Cosmopolitan Center was constructed. Multi-family residential housing (since demolished) was constructed at the same time as the Cosmopolitan Center on the eastern portion of the site. No previous environmental investigations are known to have been performed at the site. Site Geology and Hydrogeology: The site contains historic fill to a depth of approximately 4 - 9 feet. Soils found beneath the fill are characterized as sandy, clayey silt. The depth to groundwater is approximately 10 feet and flows in a northerly direction toward the Mohawk River. A No Further Action Record of Decision was signed on

POTTER STREET SITE (Continued)

S108925372

Env Problem: March 5, 2012.8/16/12-DEC signed the Certificate Of Completion for this site. Based upon the results of the Remedial Investigation (RI), the primary contaminants of concern for the site include polychlorinated biphenyls (PCBs), semi-volatile organic compounds (SVOCs) and metals. The metal and SVOCs contamination is attributable to historic fill. Impacts to groundwater remain above groundwater standards; however, the City of Utica has a groundwater use restriction in place. No volatile organic compounds (VOCs) were found at the site.PCB contaminated soil was removed as part of an interim remedial measure in June of 2011. Fifteen confirmation soil samples were taken to identify the extent of any contamination remaining following the removal. Confirmation samples along with samples collected during the Remedial Investigation demonstrate that soil meets the residential SCOs for VOCs, SVOCs and PCBs to a depth of at least 18 feet. In addition, there is no visual or olfactory evidence of contamination.A No Further Action Record of Decision was signed on March 5, 2012.

Health Problem: Remedial measures completed at the site have removed known contamination therefore no potential exposure pathways currently exist.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Registry ID: 110038697185

Environmental Interest/Information System

US EPA Assessment, Cleanup and Redevelopment Exchange System (ACRES) is an federal online database for Brownfields Grantees to electronically submit data directly to EPA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description:

Location: The site is located in an urban area in the City of Utica at 26-28 Whitesboro Street. The site is approximately 1.61 acres in size and is bounded to the north by a railroad line, to the east by Genesee Street, to the south by Whitesboro Street and to the west by commercial property. The Utica Harbor and Mohawk River are located approximately 0.25 miles north of the property. Site Features: The site is vacant and covered with a mixture of concrete sidewalks, asphalt parking and weedy vegetation. Current Zoning/Uses: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently vacant or used for a combination of commercial, public recreation and light industrial. Historical Uses: The west side of the site was historically used for the manufacturing of fishing rods and accessories, and the east side of the site was occupied by various hotels from 1925 until 1973. In 1993, the City of Utica acquired the property in lieu of back taxes. All on-site structures were demolished after a fire in 1994. Site Geology and Hydrogeology: The site contains historic fill to a depth of approximately 4 - 6 feet. Soil found beneath the fill are characterized as sandy, clayey silt. The depth to groundwater in the overburden soil is approximately 10 feet and flows in a northerly direction toward the Mohawk River.

Env Problem:

Surface and subsurface soil has been impacted by the disposal of hazardous wastes from the previous site operations. Contamination in surface soil exceeds the commercial SCOs for SVOCs and metals in a portion of the site. Subsurface soil is contaminated by volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs),

Health Problem: and metals above the commercial SCOs. Groundwater has been impacted by the disposal of chlorinated and non chlorinated solvents. Areas of grossly contaminated soil also exist in certain portions of the site. The site is not fenced and persons who enter the site could contact contaminants in the soil by walking on the site, digging or otherwise disturbing the soil. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because there is no on-site building, inhalation of site contaminants in indoor air due to soil vapor intrusion does not represent a concern for the site in its current condition. However, the potential exists for the inhalation of site contaminants due to soil vapor intrusion for any future on-site development.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: The Columbia Street Site is located on the corner of Columbia and Schuyler Streets in the City of Utica, Oneida County, New York. Whitesboro Street bounds the site on the north, Schuyler Street on the east and Columbia Street on the south. A vacant lot and residential properties are located to the west of the Site. The Site is a small lot approximately 0.08 acres in size and measures about 50 feet by 80 feet. The property is flat and contains no buildings or structures. The site is located in a mixed use area comprised of residential and commercial buildings within the downtown business district of the City of Utica. Subsurface geology includes urban fill underlain by a mixture of sand, silt and gravel. Groundwater is encountered between eight and nine feet below grade and flows to the north / north-east. The property was developed prior to 1883, with wood frame buildings of unknown use. In 1929, the property was redeveloped as a gasoline station with a mechanics bay and a hydraulic lift. The site continued to be used as a gas station and service garage under various owners until the early 1980s. From the early 1980s until 1993 the site was used by a taxi service. In 1993 the City of Utica acquired the site in lieu of back taxes and the site has remained idle. A no further action record of decision was signed on March 25, 2009. The record of decision allows for unrestricted use. A Certificate of Completion was issued on June 15, 2009.

Env Problem: As part of the first stage of the site investigation, an IRM was conducted to remove the USTs and on-site structures. The next phase of the IRM was conducted to address the only known site contamination, which was a weathered petroleum found below the former underground storage tank location. Based on field observations, confirmation sampling, surface soil sampling, test pit data and groundwater results, the IRMs have successfully addressed the known sources of impacts. Groundwater sampling shows only minor exceedances of the SCGs for two VOCs, one SVOC and metals. However, the levels are not significant and the VOC and SVOCs may be related to off site conditions. The elevated levels of metals are common and most likely related to urban fill, which has been documented at the site. In addition, City of Utica does not allow the development of private wells as a source of potable water within the City of Utica. Public water and sewer systems are available for this site. A no further action unrestricted record of decision was signed on March 25, 2009.

Health Problem: No human exposure to site contamination is expected at this site. All

contaminated soil has been removed. Residual groundwater contaminants are expected to attenuate. The City of Utica does not allow the development of private wells. The site is successfully remediated.

Site Description: Location:The Monarch Chemical Site is located in an urban area at 37 Meadow Street in the City of Utica. Site Features:The main site features include several large building foundation slabs surrounded by former parking areas and roadways and a railroad spur. About one third of the site area is enclosed by a barrier wall and is being remediated as part of the Water Gas Plant Site remedy. The nearest water supply is a private well on Smith Hill Road 2.8 miles away, and the nearest water body is Utica Harbor, which connects to the Mohawk River.Current Zoning and Land Use:The site is currently inactive, and is zoned for commercial use.The surrounding parcels are currently used for a combination of commercial and light industrial. The nearest residential area is 0.5 miles south of the site.Past Use of the Site:Sodium hypochlorite and sulfuric acid was manufactured for industrial uses at this location. A number of chemicals were stored at the facility and re-packaged for distribution. Releases occurred

through spills of material. Site Geology and Hydrogeology: The subsurface at the site is underlain by four distinct stratigraphic units consisting of fluvial and glaciolacustrine sediments. In descending order, these units are the upper sand/fill unit, the silty clay unit, the clayey sand/silty sand unit and the glacial till unit. Depths to groundwater typically range from 4 to 7 feet below the ground surface. Groundwater flow in the shallow zone is primarily toward the east-northeast and in the intermediate zone, is generally toward the north. There is a downward component of groundwater flow from shallower to intermediate aquifer.

Env Problem: Nature and Extent of Contamination: Prior to construction of the remedy, the primary contaminants of concern at the site were PAHs in surface soil and tetrachloroethene (PCE) and trichloroethene (TCE) in soil and groundwater. Soil: PAHs were limited to isolated areas, and at each of these areas, 2 feet of PAH-affected soil was excavated and disposed of off-site. 2 feet of cover has been placed over each of the excavated areas. PAH-affected soil may remain below the 2 feet of cover, but is not believed to pose a significant concern. The Declaration of Restrictions restricts site use to commercial/industrial uses and requires due diligence prior to any subsurface excavation. Groundwater: The primary contaminants in groundwater consist of PCE, TCE, 1,1,1-TCA, and their degradation products. Engineering Controls (ECs) and Institutional Controls (ICs) are required to protect human health and the environment. A dual phase extraction (DPE) system and soil-vapor extraction (SVE) wells are in place for ECs with treatment systems on site in enclosed trailers. Semi-annual and monthly sampling of groundwater wells is conducted and the groundwater remediation system effluent is sampled monthly to comply with the state pollution discharge elimination system (SPDES) permit. A deed restriction is in place prohibiting the use of the groundwater within the tract of land described in the Declaration of Restrictions.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that obtains water from a different source. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed if there is any future on-site building development and occupancy.

remediated as part of the Water Gas Plant Site remedy. The nearest water supply is a private well on Smith Hill Road 2.8 miles away, and the nearest water body is Utica Harbor, which connects to the Mohawk River. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial and light industrial. The nearest residential area is 0.5 miles south of the site. Past Use of the Site: Sodium hypochlorite and sulfuric acid was manufactured for industrial uses at this location. A number of chemicals were stored at the facility and re-packaged for distribution. Releases occurred through spills of material. Site Geology and Hydrogeology: The subsurface at the site is underlain by four distinct stratigraphic units consisting of fluvial and glaciolacustrine sediments. In descending order, these units are the upper sand/fill unit, the silty clay unit, the clayey sand/silty sand unit and the glacial till unit. Depths to groundwater typically range from 4 to 7 feet below the ground surface. Groundwater flow in the shallow zone is primarily toward the east-northeast and in the intermediate zone, is generally toward the north. There is a downward component of groundwater flow from shallower to intermediate aquifer.

Env Problem:

Nature and Extent of Contamination: Prior to construction of the remedy, the primary contaminants of concern at the site were PAHs in surface soil and tetrachloroethene (PCE) and trichloroethene (TCE) in soil and groundwater. Soil: PAHs were limited to isolated areas, and at each of these areas, 2 feet of PAH-affected soil was excavated and disposed of off-site. 2 feet of cover has been placed over each of the excavated areas. PAH-affected soil may remain below the 2 feet of cover, but is not believed to pose a significant concern. The Declaration of Restrictions restricts site use to commercial/industrial uses and requires due diligence prior to any subsurface excavation. Groundwater: The primary contaminants in groundwater consist of PCE, TCE, 1,1,1-TCA, and their degradation products. Engineering Controls (ECs) and Institutional Controls (ICs) are required to protect human health and the environment. A dual phase extraction (DPE) system and soil-vapor extraction (SVE) wells are in place for ECs with treatment systems on site in enclosed trailers. Semi-annual and monthly sampling of groundwater wells is conducted and the groundwater remediation system effluent is sampled monthly to comply with the state pollution discharge elimination system (SPDES) permit. A deed restriction is in place prohibiting the use of the groundwater within the tract of land described in the Declaration of Restrictions.

Health Problem:

Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that obtains water from a different source. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed if there is any future on-site building development and occupancy.

A deed restriction is in place prohibiting the use of the groundwater within the tract of land described in the Declaration of Restrictions.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. People are not drinking the contaminated groundwater because the area is served by a public water supply that obtains water from a different source. Volatile organic compounds in groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Currently there are no buildings on the site. An evaluation of the potential for soil vapor intrusion to occur will be completed if there is any future on-site building development and occupancy.

Site Code: 56260

Site Description: Location: The Monarch Chemical Site is located in an urban area at 37 Meadow Street in the City of Utica. Site Features: The main site features include several large building foundation slabs surrounded by former parking areas and roadways and a railroad spur. About one third of the site area is enclosed by a barrier wall and is being remediated as part of the Water Gas Plant Site remedy. The nearest water supply is a private well on Smith Hill Road 2.8 miles away, and the nearest water body is Utica Harbor, which connects to the Mohawk River. Current Zoning and Land Use: The site is currently inactive, and is zoned for commercial use. The surrounding parcels are currently used for a combination of commercial and light industrial. The nearest residential area is 0.5 miles south of the site. Past Use of the Site: Sodium hypochlorite and sulfuric acid was manufactured for industrial uses at this location. A number of chemicals were stored at the facility and re-packaged for distribution. Releases occurred through spills of material. Site Geology and Hydrogeology: The subsurface at the site is underlain by four distinct stratigraphic units consisting of fluvial and glaciolacustrine sediments. In

descending order, these units are the upper sand/fill unit, the silty clay unit, the clayey sand/silty sand unit and the glacial till unit. Depths to groundwater typically range from 4 to 7 feet below the ground surface. Groundwater flow in the shallow zone is primarily toward the east-northeast and in the intermediate zone, is generally toward the north. There is a downward component of groundwater flow from shallower to intermediate aquifer.

Env Problem: Nature and Extent of Contamination: Prior to construction of the remedy, the primary contaminants of concern at the site were PAHs in surface soil and tetrachloroethene (PCE) and trichloroethene (TCE) in soil and groundwater. Soil: PAHs were limited to isolated areas, and at each of these areas, 2 feet of PAH-affected soil was excavated and disposed of off-site. 2 feet of cover has been placed over each of the excavated areas. PAH-affected soil may remain below the 2 feet of cover, but is not believed to pose a significant concern. The Declaration of Restrictions restricts site use to commercial/industrial uses and requires due diligence prior to any subsurface excavation. Groundwater: The primary contaminants in groundwater consist of PCE, TCE, 1,1,1-TCA, and their degradation products. Engineering Controls (ECs) and Institutional Controls (ICs) are required to protect human health and the environment. A dual phase extraction (DPE) system and soil-vapor extraction (SVE) wells are in place for ECs with treatment systems on site in enclosed trailers. Semi-annual and monthly sampling of groundwater wells is conducted and the groundwater remediation system effluent is sampled monthly to comply with the state pollution discharge elimination system (SPDES) permit. A deed restriction is in place prohibiting the use of the groundwater within the tract of land described in the Declaration of Restrictions.

Health Problem: Measures are in place to control the potential for coming in contact with subsurface soil and groundwater contamination remaining at the site. Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

 DEC Region: 6
 DER Facility ID: 108741
 DEC Memo: "Prior to Sept, 2004 data translation this spill Lead_DEC Field was JOHNSON 06/20/91: PRODUCT NOTED IN EACH END OF GASOLINE TANK EXCAVATION/BUILDING END MEASURED AT APPROX. 1/2 TO 3/4 THICK/AHLES TO PUT 16 CULVERT (SLOTTED) IN EXCAVATION. (DP). 06/21/91: CULVERT PLACED IN BUILDING END OF EXCAVATION. (DP). 07/12/91: CONTAMINATED SOIL (160 YDS.) DISPOSED OF. (JM). 07/18/91: SOIL DISPOSAL PAPERWORK RECEIVED. (JM). 10/22/91: REVIEWED AND RESPONDED TO GWI REPORT DATED 8/30/91. (DJ). 01/08/92: REVIEWED AND RESPONDED TO SAMPLE RESULT REPORT DATED 12/16/91. (DJ). 03/27/92: UPSTATE SAMPLED/1/2 MW 3/ (NC). 09/11/92: REVIEWED & RESPONDED TO 4/23/92 & 8/10/92 REPORTS. NEEDS TO INSTALL GWR SYSTEM. (DJ). 01/27/05: File review: Contamination noted during removal of two 4000 gal. underground gasoline storage tanks. No tank closure report was developed. Plumley Engineering installed 5 monitoring wells across site. Two wells 3-4 had high levels of dissolved BTEX (up tot 33 ppm) and a sheen noted periodically. MW 6 and 7 were installed in the street, no hits in groundwater but utilities are present in between which have not been fully investigated as to their influence. In March of 1994 remedial plans for a sparge and vent system were received but the system was not installed. Due to RP inactivity on the site a PIN was pulled on 5/28/96 and contractor assigned. Negotiations with the RP resulted in a signed Stipulation Agreement in March of 1997. In April 1997 a CAP was signed agreeing to investigation and remediation. In Sept. 1997 five additional borings were installed along the northern property boundary, soil analysis showed soil BTEX levels as high as 207 ppm. The latest round of sampling was conducted in April 2001 after almost 3 years of inactivity. Levels in the well closest to the tank field were down significantly, however a sheen was noted. The wells are in poor condition with high levels of turbidity, iron and hardness have also been noted as being high in the past. The wells need to be redeveloped. One of the other wells which had levels of BTEX over 32 ppm has been damaged and is dry, the RP has been told to replace this well. In January 2004 letter, the consultant, Plumley Engineering, requested the spill be closed. (Tv) 01/27/05: Letter to Jack Kunkel. Due to grossly contaminated soils and a sheen on the groundwater spill cannot be closed and requires remediation. Requested submission of a remedial plan as required in the Corrective Action Plan. (Tv) 02/04/05: Call from Dale Vollmer, Plumley Eng. They will be going out to the site on February 9 to sample the wells and wil develop a response to our requests based upon the results. (tv) 11/21/2005: DEC REVIEW LETTER OF 10/25/2006 SUBSURFACE INVESTIGATION REPORT BY PLUMLEY. (JD) 7/7/2006: DEC REVIEW LETTER OF 6/22/2006 PROPOSED REMEDIAL WORKPLAN BY PLUMLEY. (JD) 5/15/2007: DEC REMINDER LETTER THAT WORK NEEDS TO BEGIN ON REMEDIAL EXCAVATION. (JD) 05/21/07 - 05/24/2007: REMEDIAL EXCAVATION COMPLETED - APPROXIMATELY 800 TONS OF CONTAMINATED SOIL REMOVED - HAULED TO ONEIDA HERKIMER COUNTY LANDFILL IN AVA FOR DISPOSAL. ABSCOPE DID WORK, PLUMLEY OVERSAW PROJECT AND CONDUCTED SAMPLING. CONTAMINATED SOILS REMOVED TO THE MAXIMUM AMOUNT PRACTICAL. BACKFILLED WITH #3 CRUSHED STONE. PIPING FOR OXYGEN RELEASING COMPOUND INJECTION SYSTEM INSTALLED. (JD) 8/17/2007: REVIEW OF REMEDIAL EXCAVATON REPORT COMPLETED BY PLUMLEY ENG. CONTAMINATED SOILS HAVE BEEN REMOVED TO THE MAXIMUM EXTENT PRACTICLE. BOTTOM DUG TO BEDROCK. SOUTHEAST WALL TO BUILDING FOUNDATION. DUG UNDER SEWER

(JA) 10/29/07: SPOKE WITH GENE SANTA CROCE, MICHAEL MAHONEY IS NEW CONTACT FOR CITY OF UTICA. SAR FROM DEC 1997 TO BE FAXED. TWO LARGER GASOLINE TANKS WERE NEVER LOCATED. PROPERTY WAS SOLD TO ITALO-GREEK ORTHODOX DIOCESE OF NORTH AMERICA ON OCTOBER 19, 1998. (JA) 10/31/07: REVIEWED INFO RECEIVED FROM CITY OF UTICA FILES. CENTRAL PUMP AND TANK CLEANED AND DISPOSED OF 500 FUEL OIL TANK IN AUGUST 1997 (see 08/08/1997 letter from city and 08/22/1997 letter from DJ). HYGEIA OF NY, INC. PERFORMED A SITE ASSESSMENT IN THE FALL OF 1997. THE SSI REPORT INDICATED THAT GASOLINE CONTAMINATION WAS FOUND AT THE SOUTH SIDE OF THE SITE NEAR THE SOUTHEAST CORNER OF THE LOT WHERE THE PUMP ISLANDS WERE. GAS CONTAMINATION IS AT 6-7' bgs AND INTO UTICA SHALE AT 7' bgs. FUEL OIL CONTAMINATION EXISTS AT THE NORTHWEST SIDE OF THE SITE WHERE THE 500 GAL TANK WAS REMOVED FROM THE SURFACE TO 6' bgs WHERE SHALE IS ENCOUNTERED. GW IS AT THE SHALE SOIL INTERFACE AND IS IMPACTED AT THE GAS AREA. HYGEIA RECOMMENDED REMOVING GAS TANKS, EXCAVATION OF SOILS AND SAMPLING GW AT THE SOUTHEAST AND NORTHWEST AREAS OF THE SITE. NOTHING IN FILE TO SHOW THAT WORK WAS PERFORMED. CITY SOLD PARCEL TO CHURCH IN OCTOBER 1998. (JA) 06/06/11: CONTRACTOR ON SITE LOCATED AND REMOVED PIPING AND TANKS. TANKS ARE 900 GAL, 1000 GAL AND 4000 GAL ALL WITH NUMEROUS HOLES. OBVIOUS CONTAMINATION NOTED. 2200 GAL WATER AND 28 GAL PRODUCT REMOVED FROM TANK PIT. NO EXCAVATION OR SAMPLING AT THIS POINT DUE TO FUNDING ISSUE. (JA) 06/24/11: TANKS HAVE BEEN CUT AND CLEANED. (JA) 10/26/11: CONTRACTOR ON SITE DOING TEST PITS. SOUTHERN TWO THIRDS OF PROPERTY HAS CONTAMINATED LAYER FROM 6' - 7.5'. ESTIMATED 400-600 YARDS TO BE REMOVED. (JA) "

Remarks: "discovered spill when driving by site. noted 500 gal ust fuel oil tank had been pulled at old gasoline station that recently been demolished. holes noted in tank and petroleum stains noted on ground"

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site Description: Location: The Mohawk Valley Oil Site is located at the intersection of Lee and Washington Streets on the Harbor Point peninsula in the City of Utica. Site Features: There are no structures on the site. The 4-acre site is flat and adjacent to Utica Harbor. Current Zoning and Land Use: The site is currently inactive and is zoned for commercial use. The site is surrounded by other inactive hazardous waste disposal sites, specifically, 633021, 633030 and 633031, which are also zoned commercial. Past Uses of Site: The site formerly consisted of three parcels: the Niagara Flats Terminal, the Texaco Terminal and Roselli Associates. The Niagara Flats Terminal was operated as a light oil processing plant and was part of the Utica Gas & Electric coal gasification facility on Harbor Point. The former Texaco Terminal contained gasoline and kerosene storage tanks. Roselli Associates provided road tar. The light oil plant and bulk storage operations occurred between 1917 and 1980. All tanks were removed in the mid-1980s. National Grid entered into an Order on Consent with the Department in 2003 for the investigation and

EPA ID Number

MOHAWK VALLEY OIL INC. (Continued)

1000160633

remediation of the site and by 2010 National Grid had aquired all three parcels. Site Geology and Hydrogeology: The site surface consists of reworked fill with concrete fragments, wood fragments and cinders. Underneath the fill lie floodplain deposits containing a high degree of silt and clay. Underneath the floodplain deposits are coarser sands followed by deeper glacial lake silts and clays. Bedrock was not encountered within 60 feet of the surface. The floodplain deposits act as an aquitard between a shallow aquifer and deeper aquifers. The aquifers generally discharge to Utica Harbor. Depth to groundwater is about 4 to 8 feet.

Env Problem: Nature and Extent of Contamination:The primary contaminants at the site include benzene, toluene, ethylbenzene, xylenes and polynuclear aromatic hydrocarbons. Non-aqueous phase liquid is also present.Groundwater:Benzene was found in groundwater as high as 5,900 ppb, exceeding the Class GA standard of 1 ppb. Benzene was found to exceed the groundwater standard throughout the site and exceeded the standard in both the shallow and a lower aquifer. Soil:Non-aqueous phase liquid was found sporadically in soil borings within the shallow aquifer, gererally in the northern portion of the site. The non-aqueous phase liquid was found in soil up to 18 feet below the ground surface. Total PAHs were found as high as 2,973 ppm and benzene ranged up to 14 ppm.Significant Threat:The site presents a significant environmental threat due to the ongoing releases from source areas of contaminants into groundwater.

Health Problem: Impacts associated with this site are being evaluated in conjunction with those associated with the entire Harbor Point area. The area is served by the City of Utica Public Water Supply. The nearest homes are one half mile away. Groundwater and subsurface soil contamination exists. The site has been fenced and vegetation is growing.

Site Description: This site was formerly used by Westinghouse as a transformer repair shop from 1929 up until the mid 1960s. Transformers were repaired at this facility periodically. It has been estimated that only about 1% of all the transformers that were brought here for repair actually contained any PCB oil. Discussions with former Westinghouse employees revealed that very little PCB oil would have been disposed of in the facility because the oil was put back into the transformers after they were repaired. The site of the transformer shop has been redeveloped. There is currently a Sears Department Store at this location, and the surrounding lot has been paved. A Phase I Investigation was completed for this site in April 1987. DEC personnel investigated and attempted to sample the site in June of 1989. The entire property is fenced in and paved, consequently, no samples could be gathered. There was no evidence anywhere on the property to indicate that PCB oil had been disposed of.

S105972672

has been completed for the harbor. A NYSDEC Phase II Investigation was completed in January 1992. The harbor has also been sampled by Niagara Mohawk as part of the continuing Remedial Investigation of the adjacent Niagara Mohawk Harbor Point Site. Results indicate that the harbor bottom sediments contain significant concentrations of polynuclear aromatic hydrocarbons (PAHs). The deeper portions of the surface water in the harbor are also impacted by coal-tar and petroleum-based by-products. Borings in the dredge disposal area indicate soil contamination with PAHs. While site media are affected, no evidence of hazardous waste disposal per 6 NYCRR 371 has been found at the site.

Confirmed HW:	Not reported
Environment Assesment:	Contamination of harbor sediments and deep surface water from non-hazardous (coal gasification & petroleum related activities) has been noted on site. There is a potential for food chain & fishery impacts.

Site Description: Site Location: The former Bossert Manufacturing Site (Bossert Site) is located at 1002 Oswego Street in the City of Utica, Oneida County, New York. This site is located in a mixed industrial, commercial, and residential area known as West Utica. Historical Uses: Prior to its complete demolition in 2002, the Bossert Site consisted of an abandoned 210,000 square foot production facility located on a 6.9 acre parcel. The multi-story complex of connected buildings was a metal stamping, welding and fabricating assembly factory from approximately 1896 to 1985. While in production, Bossert utilized polychlorinated biphenyl (PCB) oils in electrical transformers and in hydraulic metal stamping presses. A Liability Release Letter was issued for the Bossert Site. The Bossert Site was deleted from the Registry of Inactive Hazardous Waste Disposal Sites on September 15, 2008. The new SMP was negotiated and successfully approved April 4, 2013. The details of the site construction were discussed, reviewed and taken into consideration in the revised SMP. The site was successfully transferred to the developer on June 3, 2013, and site construction is scheduled to be mobilized August 1, 2013. Geology and Hydrogeology: The site lies approximately one mile south of the Mohawk River. Site groundwater flow is southeast toward Nail Creek which flows within a box culvert toward the Mohawk River. The site consists of layers of fill (debris, ash, rubble), abandoned foundations/footers, buried slabs and a native gravel layer. The last stage of the previous site remediation was the installation of a mulch cover that was placed over the entire site.

Env Problem: Nature and Extent of contamination: All site remediation work has been completed. Some residual weathered petroleum and residual PCB-contaminated soil remain at this former industrial site. No off-site environmental problems were identified. This site is no longer a significant threat to the environment. The NYSDEC approved Site Management Plan in effect for this site was updated in the

current appropriate format and approved in April 2013. The site was transferred to a developer on June 3, 2013, and is scheduled for commercial reconstruction to be mobilized on August 1, 2013.

Health Problem: The former site buildings have been razed. Engineering controls are in place to prevent exposure to known areas of contamination. An approved site management plan is in place to address future development of the site.

Site Description: Site Location: The former Bossert Manufacturing Site (Bossert Site) is located at 1002 Oswego Street in the City of Utica, Oneida County, New York. This site is located in a mixed industrial, commercial, and residential area known as West Utica. Historical Uses: Prior to its complete demolition in 2002, the Bossert Site consisted of an abandoned 210,000 square foot production facility located on a 6.9 acre parcel. The multi-story complex of connected buildings was a metal stamping, welding and fabricating assembly factory from approximately 1896 to 1985. While in production, Bossert utilized polychlorinated biphenyl (PCB) oils in electrical transformers and in hydraulic metal stamping presses. A Liability Release Letter was issued for the Bossert Site. The Bossert Site was deleted from the Registry of Inactive Hazardous Waste Disposal Sites on September 15, 2008. The new SMP was negotiated and successfully approved April 4, 2013. The details of the site construction were discussed, reviewed and taken into consideration in the revised SMP. The site was successfully transferred to the developer on June 3, 2013, and site construction is scheduled to be mobilized August 1, 2013. Geology and Hydrogeology: The site lies approximately one mile south of the Mohawk River. Site groundwater flow is southeast toward Nail Creek which flows within a box culvert toward the Mohawk River. The site consists of layers of fill (debris, ash, rubble), abandoned foundations/footers, buried slabs and a native gravel layer. The last stage of the previous site remediation was the installation of a mulch cover that was placed over the entire site.

Env Problem: Nature and Extent of contamination: All site remediation work has been completed. Some residual weathered petroleum and residual PCB-contaminated soil remain at this former industrial site. No off-site environmental problems were identified. This site is no longer a significant threat to the environment. The NYSDEC approved Site Management Plan in effect for this site was updated in the current appropriate format and approved in April 2013. The site was transferred to a developer on June 3, 2013, and is scheduled for commercial reconstruction to be mobilized on August 1, 2013.

Health Problem: The former site buildings have been razed. Engineering controls are in place to prevent exposure to known areas of contamination. An approved site management plan is in place to address future development of the site.

Site Description: Site Location: The former Bossert Manufacturing Site (Bossert Site) is located at 1002 Oswego Street in the City of Utica, Oneida County, New York. This site is located in a mixed industrial, commercial, and residential area known as West Utica. Historical Uses: Prior to its complete demolition in 2002, the Bossert Site consisted of an abandoned 210,000 square foot production facility located on a 6.9 acre parcel. The multi-story complex of connected buildings was a metal stamping, welding and fabricating assembly factory from approximately 1896 to 1985. While in production, Bossert utilized polychlorinated biphenyl (PCB) oils in electrical transformers and in hydraulic metal stamping presses. A Liability Release Letter was issued for the Bossert Site. The Bossert Site was deleted from the Registry of Inactive Hazardous Waste Disposal Sites on September 15, 2008. The new SMP was negotiated and successfully approved April 4, 2013. The details of the site construction were discussed, reviewed and taken into consideration in the revised SMP. The site was successfully transferred to the developer on June 3, 2013, and site construction is scheduled to be mobilized August 1, 2013. Geology and Hydrogeology: The site lies approximately one mile south of the Mohawk River. Site groundwater flow is southeast toward Nail Creek which flows within a box culvert toward the Mohawk River. The site consists of layers of fill (debris, ash, rubble), abandoned foundations/footers, buried slabs and a native gravel layer. The last stage of the previous site remediation was the installation of a mulch cover that was placed over the entire site.

Env Problem: Nature and Extent of contamination: All site remediation work has been completed. Some residual weathered petroleum and residual PCB-contaminated soil remain at this former industrial site. No off-site environmental problems were identified. This site is no longer a significant threat to the environment. The NYSDEC approved Site Management Plan in effect for this site was updated in the current appropriate format and approved in April 2013. The site was transferred to a developer on June 3, 2013, and is scheduled for commercial reconstruction to be mobilized on August 1, 2013.

Health Problem: The former site buildings have been razed. Engineering controls are in place to prevent exposure to known areas of contamination. An approved site management plan is in place to address future development of the site.

 DEC Memo: "Prior to Sept, 2004 data translation this spill Lead_DEC Field was JOHNSON The following summary is by the Project Manager, John Durnin on September 19, 2006: This Class 2 site has been remediated under the State Superfund Program. There are two Record of Decisions (ROD) associated with this site. The January 1996 ROD was for OU#1 (building and presses) and the March 2002 ROD (subsurface and demolition debris) was for OU#2. The May 2004 Remediation Report for the Bossert Manufacturing Site was approved on July 8, 2004. This documents the removal of the PCB-contaminated demolition debris, related PCB-contaminated soils, buried piping and selected foundations. This removal action occurred between August 2003 and December 2003. The (source) removal and off-site disposal of the on-site underground storage tank and related petroleum-contaminated soil took place between November 2003 and February 2004. All work was performed by the City of Utica. Site work was overseen by the NYSDEC Project Manager, John Durnin. In July 2004 the entire (vacant) site was covered with 6 inches of compost material. All site work has been completed. The undeveloped site continues to be fenced and locked. The Site Soils Management Plan was approved on February 16, 2005. A Liability Release Letter for this site was signed on August 31, 2006. Based on the above remedial work, this Spill No. 0306986 site is closed."
 Remarks: "took pipe apart and oil ran out of pipe"

Site Description: Location: The Universal Waste site is located on the intersection of Wurz Ave and Sewage Plant Road in City of Utica, Oneida County. The site is comprised of tax parcels 319.05-1-32, and part of 319.05-1-36, 319-9-1-73 and 319.05-1-37. This fact sheet announces the investigation of off-site areas. Site Features: The site is bordered by the river to the north. On the west side of the site there is a former petroleum bulk storage facility. Immediately east of the Universal Waste site is a former C&D recycling facility which is empty, unoccupied and largely wooded. Further east-southeast of the site is largely wooded and swampy and remains unoccupied. It contains wetlands and channels discharging into Mohawk River. The Mohawk River seems to frequently flood this area. The Universal Waste site is approximately 22 acres. Site is partly fenced. There are few buildings on site. North of the Universal Waste site is generally wooded. There is a storm sewer line transecting the site west to east and draining into a stream in the property east of the site. The stream flows further east into a small pond and from there discharges to Mohawk River. Current Zoning/Use: The site and surrounding area is currently zoned industrial. Historical Uses: The site is an inactive scrap yard salvaging ferrous and stainless steel. The site handled electrical components, including transformers that contained PCBs. The Universal Waste site is owned by Clearview Acres, Ltd. From approximately 1957 until 2008, the site was operated by Universal Waste, Inc. In 2008, ELG Utica Alloys, Inc. acquired Universal Waste,

S106152814

Inc. A work plan to perform a limited on-site remedial investigation of the Universal Waste site was approved in April 2013. Areas located towards the north, east and south are generally referred to as off-site. The off-site remedial investigation and feasibility study (RI/FS) is to be conducted using state superfund monies. A separate work plan is developed and is being implemented. Operable Units: The site consists of two operable units. OU01 is comprised of tax parcels 319.05-1-32, and part of 319.05-1-36, 319-9-1-73 and 319.05-1-37 constituting the Universal Waste, Inc., referred to as on-site. OU02 consist of lands to the north, south and east (including the Mohawk River) of Universal Waste, Inc. site and is referred to as off-site.

Site Geology and Hydrology: Currently not known.

Env Problem: Nature and Extent of Contamination: Prior activities include recovering and recycling operations of the ferrous metals and stainless steel has contaminated the site and the down gradient properties with PCBs. The data collected to date shows that the soil and ground water is predominantly contaminated with PCBs and the contamination is migrates off-site and impacting down gradient properties. As result of recycling and recovery operations conducted at the site, large quantities of PCBs were released at the site from approximately 1957 to 1978. PCBs as well as other contaminants were detected in soil and ground water during two preliminary site investigations. One of the PCB contaminated areas is located adjacent to the sewer outfall channel towards east of the Universal Waste Inc. property. Special Resources Impacted/Threatened: PCBs were identified in the discharge channel sediment at levels exceeding Departments guidance values and standards. The backwater area of the Mohawk River is also contaminated with PCBs. In March 1998, the Department's Hale Creek Field Station identified the ditch behind Universal Waste as a PCB "hot spot" affecting the Mohawk River. New York State has issued a Fish Consumption Advisory for a reach of the Mohawk River stretching upstream and downstream of the site. Additional studies are required to quantify the release from the Universal Waste site.

Health Problem: Significant Threat: The site presents a significant threat to the environment and human health due to the release of PCBs to off-site parcels and the Mohawk River.

The site is fenced and is located in an industrial area. The nearest residence is approximately 2000 feet away. All residences and businesses in the area use public water. Ambient air sample results did not reveal any significant levels of contamination.

Site Description: Location: The site is located at the corner of Wurz Avenue and Leland Avenues in an industrialized area of the City of Utica, Oneida County. The site is bordered to the south by the Leland Avenue extension leading to the county sewer plant and Oneida-Herkimer Solid Waste Authority (OHSWA), and then a railroad switching yard that runs east-west. The City of Utica Fire Department Training Facility, an inactive hazardous waste disposal site (the Universal Waste Site (Registry number 633009)), a gravel road, and the Mohawk River are to the north of the site and a bulk petroleum tank farm (terminal) is to the northwest. The City of Utica Transit Authority, Leland and Wurz Avenues, a parking lot, and vacant land are located to the west of the site. The Universal Waste Site and wooded vacant land (United Contractors) are located to the east of the site. Further east is Mohawk River. Site Features: The site is approximately 1.96 acres in size, with a large building (approximately 38,000 square feet) located generally on the northern and eastern side of the site. A pad and a lot largely occupies southern portion of the site. The western portion of the site is lightly vegetated. The site is generally flat. There are no natural features on the site Current Zoning/Use: The site and the area towards west are industrial. Immediate North and east is an industrial property (Universal Waste Inc.). Historical Uses: The Utica Alloys facility recycled specialty metal turnings generated offsite by machining operations typically connected with the production of aerospace parts and equipment. The site was formerly part of the Universal Waste Site, which was used as a waste scrapyards and recycling facility. Hazardous waste disposal occurred at both sites. Presently, the site is part of the ELG Stainless Division. The Stainless Division operates in the warehouse located north of the site (on the Universal Waste Site). The site warehouse is utilized for staging material and warehousing equipment. Based on investigations performed in the past, volatile organic compounds (VOCs) including trichloroethylene (TCE) and polychlorinated

S106152816

biphenyls (PCBs) contamination were observed in soil and/or ground water. Interim Remedial Measures (IRM) were approved in September 2007. An IRM was conducted to excavate certain areas to eliminate potential sources of TCE and PCB contamination, and to perform ground water monitoring and sub slab and indoor air monitoring. Approximately, 600 tons of soil was excavated and transferred off-site for disposal. An IRM Construction Completion report was approved by the Department in May 2011. The Supplemental CSM Investigation Work Plan is proposed to fully delineate the extent of the contamination. Site Geology and Hydrology: Based on prior data collected, the overburden materials encountered at the site consist of two units: fill and fluvial deposits. Surficial fill materials are found across the site. Fill material consist of sand, silt, gravel and various debris such as brick fragments, cinders, glass, metal and other material. Fill material ranged in thickness from 4 ft to 10 ft. Composition of the fluvial deposits varied ranging from silt and/or clay with little to no gravel to gravel and some sand. Based on regional geologic conditions bedrock could be expected at about 240 ft below grade surface (bgs). In the past, ground water has been encountered at shallow depths ranging from 0.2 to 5 below grade surface (bgs) and was generally flat and trending east towards the Mohawk River.

Env Problem: Nature and extent of Contamination: Elevated concentrations of TCE have been detected in both groundwater and subsurface soils at this site. The extent of off-site impacts has not been determined. An IRM was completed in 2008 to address PCB. The IRM and related monitoring well reports show that there are elevated TCE levels in site soil and groundwater. An SVI study was also completed which determined that mitigation is necessary. The Department is in process of reviewing Conceptual Site Model Investigation work plan which will determine the extent of contamination. Special resources Impacted: The site is located near the Mohawk River. To date there is no off-site investigation. Off-site groundwater impacts are anticipated as groundwater wells on-site contain chlorinated organics above standards. Significant Threat: The site presents a significant environmental and public health threat due to the ongoing release of contamination to groundwater and soil vapor.

Health Problem: Groundwater and soil contamination have been documented. However, the area is served by public water and site access is restricted by a perimeter fence.

Site Description: Location: The Primoshield Site consists of all or portions of six properties situated between Conkling Avenue and St. Vincent Street in Utica. The main focus is two parcels designated as 1223 Conkling Avenue (tax map parcel number 41) and 1212 St. Vincent Street (tax map parcel number 33). The Primoshield site is located in a mixed commercial/ residential area of Utica in Oneida County. Site Features: As of 2004, the remediated site is a fenced, 0.82-acre lawn containing a small concrete block building. The lawn is currently mowed by the city of Utica. Additional contiguous property, 1.58 acres, was investigated and deemed not to need remediation. Current Zoning/Use(s): Primarily commercial land with a tiny piece of residential property within the fenced area. Historical Use(s): Primoshield was a metal electroplating facility that was abandoned in August of 1985. The property consisted of office and factory buildings, a small laboratory and a storage trailer. Included in the original Primoshield property was an adjacent gravel parking lot not owned by Primoshield. The city of Utica is currently the owner of the remediated site. When the facility was abandoned, a number of drums and open vats (some containing acids, cyanide solutions and spent plating solutions) were left scattered over the entire property. In 1986 and 1987, EPA removed and disposed all of the containerized wastes at approved disposal locations. All of the structures on the property were demolished and also removed. Soil and groundwater contamination was confirmed. NYSDEC negotiated a Title 3 Consent Order and a State Assistance contract with the City for a Remedial Investigation/ Feasibility Study (RI/FS). Field work for the RI was completed in October of 1993. The RI/FS was completed in 1995, and a Record of Decision (ROD) was signed on March 22, 1995. The ROD called for construction of a groundwater pump and treat (P&T) system where contaminated groundwater was treated by carbon filtration prior to being discharged to a POTW. The P&T system

worked effectively, the groundwater contaminant levels dropped significantly over time, and the carbon filters were removed in the spring of 2001. The system now collects groundwater and pumps it to the POTW under permit. Continuing site management consists of five-quarter groundwater samplings, maintenance of the pumping system, six-month inspections (they were monthly through 2012), administration of the site's discharge permit, and an annual IC/EC certification report. Site Geology and Hydrogeology:Dense, silt-rich clay over shale. Depth to groundwater is five to ten feet below the ground surface.

Env Problem: Prior to RemediationBased upon investigations conducted, the primary contaminants of concern at the site include cadmium, chromium, trichloroethene, trichloroethane, TCE, dichloroethane, benzene, toluene and metals (spent plating solutions), acids, and cyanide solutions.Post-RemediationAnalytical data shows that the groundwater impact has diminished, indicating that the remedy was effective. The carbon filters were removed in 2001, and the groundwater is now pumped directly to the POTW.Consequently, the frequency of groundwater monitoring was reduced in 2002 to once every 15 months. A Vapor Intrusion evaluation was conducted in 2008. The evaluation recommended no further action with respect to vapor intrusion.Groundwater results in 2014 indicate low-level groundwater contamination by volatile organic compounds and nickel which is similar to what has been observed since 2002.

Health Problem: Contaminated surface soils have been removed from the site as well as a neighboring private residence. Additional efforts to eliminate the entry of contaminated groundwater into the basement of a neighboring home have been completed. Recent samples collected from the adjacent private residence did not reveal any site related contamination.

Site Description: Location: The Primoshield Site consists of all or portions of six properties situated between Conkling Avenue and St. Vincent Street in Utica. The main focus is two parcels designated as 1223 Conkling Avenue (tax map parcel number 41) and 1212 St. Vincent Street (tax map parcel number 33). The Primoshield site is located in a mixed commercial/ residential area of Utica in Oneida County. Site Features: As of 2004, the remediated site is a fenced, 0.82-acre lawn containing a small concrete block building. The lawn is currently mowed by the city of Utica. Additional contiguous property, 1.58 acres, was investigated and deemed not to need remediation. Current

Zoning/Use(s): Primarily commercial land with a tiny piece of residential property within the fenced area. Historical Use(s): Primoshield was a metal electroplating facility that was abandoned in August of 1985. The property consisted of office and factory buildings, a small laboratory and a storage trailer. Included in the original Primoshield property was an adjacent gravel parking lot not owned by Primoshield. The city of Utica is currently the owner of the remediated site. When the facility was abandoned, a number of drums and open vats (some containing acids, cyanide solutions and spent plating solutions) were left scattered over the entire property. In 1986 and 1987, EPA removed and disposed all of the containerized wastes at approved disposal locations. All of the structures on the property were demolished and also removed. Soil and groundwater contamination was confirmed. NYSDEC negotiated a Title 3 Consent Order and a State Assistance contract with the City for a Remedial Investigation/ Feasibility Study (RI/FS). Field work for the RI was completed in October of 1993. The RI/FS was completed in 1995, and a Record of Decision (ROD) was signed on March 22, 1995. The ROD called for construction of a groundwater pump and treat (P&T) system where contaminated groundwater was treated by carbon filtration prior to being discharged to a POTW. The P&T system worked effectively, the groundwater contaminant levels dropped significantly over time, and the carbon filters were removed in the spring of 2001. The system now collects groundwater and pumps it to the POTW under permit. Continuing site management consists of five-quarter groundwater samplings, maintenance of the pumping system, six-month inspections (they were monthly through 2012), administration of the site's discharge permit, and an annual IC/EC certification report. Site Geology and Hydrogeology: Dense, silt-rich clay over shale. Depth to groundwater is five to ten feet below the ground surface.

Env Problem: Prior to Remediation Based upon investigations conducted, the primary contaminants of concern at the site include cadmium, chromium, trichloroethene, trichloroethane, TCE, dichloroethane, benzene, toluene and metals (spent plating solutions), acids, and cyanide solutions. Post-Remediation Analytical data shows that the groundwater impact has diminished, indicating that the remedy was effective. The carbon filters were removed in 2001, and the groundwater is now pumped directly to the POTW. Consequently, the frequency of groundwater monitoring was reduced in 2002 to once every 15 months. A Vapor Intrusion evaluation was conducted in 2008. The evaluation recommended no further action with respect to vapor intrusion. Groundwater results in 2014 indicate low-level groundwater contamination by volatile organic compounds and nickel which is similar to what has been observed since 2002.

Health Problem: Contaminated surface soils have been removed from the site as well as a neighboring private residence. Additional efforts to eliminate the entry of contaminated groundwater into the basement of a neighboring home have been completed. Recent samples collected from the adjacent private residence did not reveal any site related contamination.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/07/2016	Source: EPA

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Date of Government Version: 03/07/2016	Source: EPA

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 12/09/2015	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/02/2016	Telephone: (212) 637-3660

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State and tribal voluntary cleanup sites**VCP: Voluntary Cleanup Agreements**

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a \$200 million Environmental Restoration or Brownfields Fund as part of the \$1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

E DESIGNATION: E DESIGNATION SITE LISTING

The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

 Data Release Frequency: Varies

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013	Source: Department of Energy & Environmental Protection

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300

The National Center for Education Statistics' primary database on private school locations in the United States.

Southwest Map: 5938535 UTICA WEST, NY
Version Date: 2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> ONEIDA, NY	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> UTICA EAST	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:
 Search Radius: 1.25 miles
 Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: URBAN LAND

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

1	0 inches	5 inches		Not reported	Not reported	Max: Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: UDORTHENTS, SMOOTHED

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 137 inches

No Layer Information available.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 3

Soil Component Name: ALTON

Soil Surface Texture: very gravelly sandy loam

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Well drained

Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	24 inches	40 inches	very gravelly sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 7.3 Min: 5.1
2	9 inches	24 inches	very gravelly fine sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 7.3 Min: 5.1
3	0 inches	9 inches	gravelly loam	Not reported	Not reported	Max: 42 Min: 14	Max: 5.5 Min: 4.5
4	40 inches	57 inches	very gravelly sandy loam	Not reported	Not reported	Max: 42 Min: 14	Max: 7.3 Min: 5.1
5	57 inches	72 inches	very gravelly loamy sand	Not reported	Not reported	Max: 141 Min: 42	Max: 7.8 Min: 6.6

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands

Source: Department of Environmental Conservation

Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Radon Test Results

Area Radon Information

Source: USGS

Telephone: 703-356-4020

The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones

Source: EPA

Telephone: 703-356-4020

Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

 Contact: Chris Dousharm

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by O'Brien & Gere Engineers, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDR's Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:**Coordinates:**

P.O.#	10062230	Latitude:	43.103526 43° 6' 13" North

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

**PHASE I ENVIRONMENTAL ASSESSMENT
401-407 AND 409 COLUMBIA STREET
UTICA, NEW YORK**

prepared for

**Adirondack Bank
185 Genesee Street
Utica, New York**

February 4, 2002

1.0 INTRODUCTION

This report presents the results of a phase I environmental assessment performed by Geoscience Technical Services Inc. on property at 401-407 and 409 Columbia Street in Utica, New York. The site contains two connected buildings owned by the Resource Center for Independent Living (RCIL) and occupied by that group and tenants. The property is identified as Oneida County tax map 318.41-2-38 and 318.41-2-40.

Elements of the assessment included a site inspection, discussions with local officials and individuals, research at the municipal and county levels, evaluation of site history, and examination of State and US EPA documents. It updates an earlier assessment performed on 401-407 Columbia Street by Geoscience Technical Services in 1994.

2.0 BACKGROUND

The property is located at the southwest corner of the intersection between Columbia and Cornelia Streets in the downtown section of Utica (Figure 1). In composite, the two lots have a square configuration with an area of 1.17 acres (Figure 2). Frontage includes 225 feet on Columbia and 212 feet on Cornelia.

The building at 401-407 Columbia is a four story brick structure with a full basement. Dimensions are 95 by 148 feet yielding a footprint of 14,504 square feet. The first through third floors are used as offices. The fourth floor is partly leased and the remainder is an unfinished area used for storage. The basement is also unfinished.

The 409 Columbia Street building, which houses the main office of RCIL, is a one story pre-engineered metal building on a concrete slab. It has basic dimensions of 95 by 144 feet with one corner missing resulting in a floor area of 13,904 square feet.

In the late 1800's, the property contained part of the Theodore Pomeroy & Son oil cloth factory. Those buildings were removed by 1899. The present building at 401-407 Columbia was constructed by 1907 and used over the years for a furniture store, clothing factory, light manufacturing, and offices.

Initially residences and later commercial buildings occupied the 409 Columbia lot. The buildings contained part of the clothing factory and also auto sales and service operations. They were replaced in 1971 by the present building. That building was occupied from 1971 to 1990 by a rug company.

The neighborhood contains commercial, residential, and municipal buildings. A large mill building on the west side of State Street is occupied by Brook Park and a machine company. The Utica City Hall lies one block to the east on Kennedy Plaza. Automotive operations are located on Lafayette and Criskany Streets to the south. The nearest gas station is a Mobil/Nice & Easy at Court and State.

3.0 UTILITIES AND STORAGE TANKS

The buildings have municipal water and sewer service. There is one catch basin in the rear parking lot which we assume is connected with the City storm sewer system.

Heating of both buildings takes place with natural gas which is piped in.

Fuel oil and coal were used to heat the 401-407 Columbia Street building in the past. An above-ground tank with an estimated capacity of 1,100 gallons is located in the basement near the former furnace. The tank was cut open and is filled with sand or concrete.

These elements of electrical systems pertinent to environmental assessments are transformers and capacitors which may contain dielectric fluid with polychlorinated biphenyls (PCB's). No transformers were observed on the property. The ballasts of fluorescent lights, which are present in both buildings, have small capacitors that are assumed to contain PCB's unless labeled otherwise. These do not constitute a soil or ground water contamination threat, but unlabeled ballasts must be treated as a hazardous waste when disposed.

4.0 SITE INSPECTION

The site inspection took place on January 24, 2002. Site photographs taken that day are shown in Appendix A.

4.1 401-407 Columbia Street Building

description At the time of our inspection, this building was occupied as follows:

- first floor - RCIL
- second floor - Family Services and AIDS Community Services
- third floor - Voluntary Action Center, U.S. Care, and RCIL
- fourth floor - Computer & Business Inc. and RCIL storage

The first through third floors are laid out for offices, exemplified by the first floor plan shown in Figure 3. In general, each floor has a square hall with offices on the interior and exterior. There is one elevator and two staircases. Finish materials include vinyl and carpet flooring, sheetrock walls, and drop tile ceilings.

That part of the fourth floor occupied by Computer & Business is finished as offices. The remainder, including two large rooms, is unfinished and used by RCL for storage of furniture, computers, and files. This area has a wood floor, masonry walls, and the original wood and metal ceiling.

The unfinished basement is divided into four sections, each elongate in the north-south direction. The east section contains the new and old furnaces, the decommissioned oil tank, and utility entrances. The other sections are used for miscellaneous storage and a cooling unit is located in the west section.

chemicals Other than cleaners, the only chemical items observed were located in the basement. These included two dozen 1 to 5 gallon containers of paint in a metal cabinet; and fourteen pint to 5 gallon containers of paint and 1 gallon of thinner elsewhere. The containers were intact and there was no staining on the floor.

asbestos-containing materials About 115 linear feet of overhead pipe were covered with asbestos insulation at the time of our 1994 assessment. This was removed during renovations conducted subsequently and we observed no asbestos insulation in January 2002.

Vinyl flooring and drop ceiling tiles, which are present in the finished sections of the building, may contain an admixture of asbestos if they were installed prior to the mid-1980's. Installation dates are uncertain and probably varied. Vinyl flooring and drop ceiling tiles are categorized as non-friable materials which would not release asbestos fibers to the air unless disturbed. Disturbance could result from remodeling or removal.

lead paint Based on the building age, lead paint could be present on interior surfaces predating 1978. Many of the older surfaces have been replaced during remodeling, but some probably remain. We observed paint to be in a good condition.

4.2 408 Columbia Street Building

The interior of 408 Columbia Street contains the main RCL offices and is laid out as shown in Figure 3. In addition to offices, rooms include the lobby, a library, a conference room, a kitchen, the AOS activities room, and rest rooms. Finish materials include carpeted and vinyl flooring, sheetrock walls, and drop tile ceilings.

chemicals The only chemical-type items observed were located in the kitchen

closet and included 20 to 40 pint to gallon containers of cleaners, ammonia, and bleach used for maintenance.

Asbestos-containing material and lead paint RCIL completely remodeled the building interior in 1991 shortly after acquisition. This infers that asbestos-containing materials and lead paint would not be present.

4.3 Grounds

Grounds include a paved parking lot in the rear of the buildings bordered by a strip of landscaping, and a courtyard to the west of number 409. One catch basin and a sewer manhole were present in the parking lot pavement. The ground surface was wet which prevented identification of oil staining.

We observed no fill pipes, fill ports, or vent pipes for underground tanks outside the buildings. No solid waste was present.

Immediately adjacent properties include a parking lot for the Kennedy Plaza Apartments to the south and O'Brien Plumbing & Heating Supply to the west. The Salvation Army Thrift Store and Shepard Paint & Wallpaper are located to the north across Columbia Street. A large building occupied by Mohawk Valley Hospital Equipment lies to the east across Comelia.

5.0 MUNICIPAL RESEARCH

Tax Assessor Documents in the Utica Tax Assessor's office included the property description as summarized in Section 2.

County Clerk Land records in the County Clerk's office show the following chains of ownership for the parcels.

401-409 Columbia Street

1994 to present - Resource Center for Independent Living
 1993 to 1994 - Savings Bank of Utica
 1989 to 1993 - Nancy Jones
 1987 to 1989 - Savings Bank of Utica
 1983 to 1987 - Mohawk International
 1983 - Robert Gardillo
 1977 to 1983 - Charles Gaetano and Gaetano Realty Corp.
 1942 to 1977 - Tudor Williams Realty Company

409 Columbia Street

1990 to present - Resource Center for Independent Living

5

1972 to 1990 - Kymark Realty Corp.
 1971 to 1972 - Meelan Rug Company
 owner prior to 1971 - Ulica Urban Renewal Agency

Codes Enforcement The Codes Enforcement files for the property included the following:

401-407 Columbia Street

- permits, inspection reports, and CO's for remodeling conducted in 1989 and 1994-1995.
- a 7/21/88 hazardous materials report for former tenant Electromark listing 55 gallon containers of ethyl acetate, acetone, nitrocellulose, anhydrous solvent, and hexane.
- 1987 tenant complaints about poor air quality and an indoor air survey performed by Galson Technical Services.

409 Columbia Street

- permit to erect a steel Butler building for a retail rug company issued in 1971.
- permits, inspection reports, and CO's for a 25 by 90 foot addition and RCIL remodeling in 1990 and 1991.

Fire Department The following calls for issues other than alarm malfunctions and smoke detectors were made to 401-407 and 409 Columbia Street by the Ulica Fire Department during the past two decades:

- 2/18/85 - odor of cleaning fluid
- 6/10/86 - odor of smoke
- 12/28/86 - odor of stain
- 12/14/91 - roof blown off #409
- 1/20/94 - electrical fumes
- 3/18/96 - gasoline leak (presumably from a car, possibly on the street)

6.0 SITE HISTORY

Information used to reconstruct the history of 401-407 and 409 Columbia Street includes deeds and other municipal information; 1874 and 1907 Oneida County atlases; Sanborn insurance maps from 1884, 1888, 1895, 1925, and 1930; Ulica city directories; and aerial photographs taken in 1957, 1977, and 1984. Copies of the Sanborn maps and photos are included in Appendix B.

Uses of the properties based on these sources of information are summarized as follows:

401-407 Columbia Street parcel

1874 to late 1880's - occupied by Thomas Pomeroy & Son oil cloth factory. Oil, paint, varnish, and lead were stored on-site. Operations included painting, varnishing, printing, sizing, rubbing, and coating.

1890 - parcel vacant except for a small hand laundry at the corner.

1907 - present building constructed, labeled J. Cox.

1925 - building shown as 3 stories at street level; clothing factory on the 3rd and 4th floors.

1935 to 1970 - primary building occupant Williams & Tudor Furniture. At times, the upper floors were occupied by a clothing factory. A restaurant and confectioner were also briefly present.

1970 to early 1980's - building vacant.

1983 to 1987 - Mohawk International, later called Electromark manufactured tools and equipment for etching of metal in part of the building. Their operation is further discussed in Section 3.1. The remainder of the building was partly used for offices.

1987 to present - the building was used exclusively for offices during this period. RCIL became the owner in 1994.

408 Columbia Street parcel

late 1850's to early 1900's - occupied by residences.

first half of 20th century - north section occupied by a large building extending to the west. The building contained an auto sales & service operation on the ground floor and a clothing factory on three upper floors. The rear section, coinciding with the present parking lot, was occupied by another building with an auto sales & service facility.

prior to 1970 - former buildings removed.

1970 to 1990 - present building constructed and occupied by Meelan Rug Company.

1990 to present - interior remodeled and occupied by RCIL.

Due to the passage of time, there is no specific information on the storage, use, and disposal of chemicals and petroleum products used by the oil cloth factory and auto sales & service operations.

7.0 REVIEW OF STATE AND FEDERAL INFORMATION

7.1 Geologic Setting

The U.S. Geological Survey topographic map shows that the property is located on the lower flank of a hill sloping gently north towards the Mohawk River (Figure 1).

Surficial sediments are mapped as loesslike sand deposited in a lake which occupied the Mohawk Valley during retreat of the last continental glacier (Cadwell and Dineen, 1987). Bedrock, which is buried beneath the sand, consists of the sedimentary Utica shale (Fisher, Jacobsen, and Richard, 1970).

The property lies over a productive ground water aquifer extending along the Mohawk valley (Buglioni, Trudell, and Casey, 1988). The area has municipal water service. Based on a 1982 atlas, there are no community water supply sources within a one mile radius.

7.2 Environmental Information

The following state and federal documents were searched for references to 421-427 and 405 Columbia Street and nearby properties.

NYS DEC documents:

- inventory of inactive hazardous waste sites
- spill list, 1990 to present
- inventory of bulk petroleum storage tanks
- list of leaking underground storage tanks (developed from the spill list)
- locations of solid waste landfills

US EPA documents:

- RCRAIS (inventory of hazardous waste generators, transport, storage, & disposal facilities; and facilities subject to corrective action)
- CERCLIS (overall federal inventory of hazardous waste sites)
- National Priorities List (Superfund sites)

One reference was found to the subject property, namely an NYS DEC spill incident report dated 2/13/87. The incident concerned chemical drums left in the

assessment when Electromark moved to another location. This incident is discussed in detail in Section 8.1.

The remainder of Section 7.2 concerns the environmental condition of nearby properties.

hazardous waste sites Five inactive hazardous waste sites are listed by NYS DEC within one mile:

Dossart Manufacturing Corp. - 0.83 miles northwest
 Mohawk Valley Oil - 0.86 miles northeast
 Monarch Chemical Co. - 0.69 miles northeast
 New York Emulsion Tar Products - 0.64 miles northeast
 Niagara Mohawk Harbor Point property - 0.80 miles northeast

Of these, all but Monarch Chemical Co. are listed by US EPA in the CERCLIS which is an overall federal inventory of known and suspected hazardous waste sites. Also in the CERCLIS are:

421-493 Broad Street - 0.86 miles east
 Ullica Harbor - 0.88 miles northeast

There are no sites on US EPA's National Priority List (Superfund clean-ups) within a mile.

hazardous waste generators A total of twenty operations within a quarter mile are registered for hazardous waste activity under US EPA's RCRA program. The closest are:

Brodock Press, 714 State Street
 Fisher Auto Parts, 327 Lafayette Street
 Mather, Evans & Dishico Inc., 509 Lafayette Street
 Metzler Printing, 317 Lafayette Street
 Miguel's Body Shop, 520 Lafayette Street Rear
 Noe & Easy #8, 501 Court Street
 OAP Engine Rebuilders, 446 Lafayette Street
 Ullica Printing & Mailing, 422 Lafayette Street
 Victory Markets, 450 Columbia Street

Registrants are required to manage, store, transport, and dispose of hazardous waste in accordance with state and federal regulations.

spills The NYS DEC spill inventory, which extends back to the late 1970's, documents thirty-nine incidents within an approximate quarter mile radius. These are

listed in Table 1. One was the 2/13/97 incident at the subject property discussed further in Section 2.1. The remainder primarily involved releases of petroleum products and were distributed as follows:

Columbia Street - 4 incidents
Court Street - 6 incidents
Genesee Street - 15 incidents
Kennedy Plaza - 1 incident
Lafayette Street - 1 incident
Oriskany Street - 6 incidents
State Street - 1 incident

The Columbia Street incidents occurred at the DTB facility (#232, two incidents), the Daily Double Cafe, and along the street (leak from a moving vehicle).

registered petroleum storage tanks Bulk petroleum storage tanks have been registered with NYS DEC by the following operations within an approximate one block area.

Empire Bath & Kitchen, 500 State Street
Globe Mill Joint Venture, 721 & 811 Court Street
H. J. Brandies Corp., 300 Lafayette Street
Nice & Easy #8, 501 Court Street
The Salvation Army, 400 Lafayette Street
Ulica City Hall, 1 Kennedy Plaza

Registration is required if the cumulative capacity of above-ground and underground petroleum tanks, whether active or inactive (removed), exceeds 1,100 gallons. Some registered tanks have been removed.

chemical bulk storage tanks and major petroleum storage facilities No chemical bulk storage tanks or major petroleum storage facilities are located within a quarter mile from the subject property.

3.0 RECENT ENVIRONMENTAL ISSUES

3.1 NYS DEC Spill Incident #867005

Electromark, which was a tenant at 401-407 Columbia Street from 1953 to 1956, used a variety of chemicals, some flammable, in connection with their manufacturing of hardware and equipment for etching of metals. An NYS DEC report dated 9/3/80 stated that Electromark was operating as a small quantity generator of hazardous waste. The inspection found no violations of New York State hazardous

waste regulations.

Electromark moved to a new location at the end of 1965. An NYS DEC spill report dated 2/18/67 stated that 25 to 30 drums had been left in the basement of the building, some with contents which had spilled to the floor and entered cracks. Tenants were complaining about odors. The spill unit closed the incident on 2/18/67 and referred the matter to other branches of NYS DEC.

NYS DEC issued a fine to Electromark on 3/3/67 for not properly marking drums with flammable contents as hazardous waste.

Harry Warner of NYS DEC made a follow-up inspection documented in a letter dated 4/1/67. He stated that all drums, including those with hazardous waste, had been removed. When at the site, he did not notice any odor and observed no spilled materials on the floor. Mr. Warner opined that the problem was the result of an industry sharing a building with tenants that are not used to industrial conditions. This appears to have concluded the matter.

Documents pertaining to Electromark and the drums are contained in Appendix C.

8.2 Indoor Air Quality at 401-407 Columbia Street

Tenant concerns about building air quality first surfaced in early 1967 at the time of the Electromark incident. Galson Technical Services was engaged to conduct an air quality survey and evaluate the building ventilation system. Recommendations included providing more outdoor air, increasing the humidity, and creating positive pressure to keep fumes out of offices. The drums were subsequently removed. It is not certain whether additional measures were taken at that time.

In mid-1964, Eisenbach Engineering conducted a drilled air quality study in the building for RCIL after employee complaints about stale or stagnant air. Results for the first, second, and third floors showed nothing out of the ordinary for temperature, carbon dioxide, and humidity. Humidity was somewhat high on the first floor and carbon dioxide was slightly elevated on the second floor.

Another air quality survey was performed in March 1986 by CNA Insurance Companies, responding to a lawsuit from an employee alleging health impacts from poor air. Monitoring included dust, hydrocarbons, formaldehyde, carbon dioxide, and carbon monoxide. Results showed one of six carbon dioxide levels elevated and a somewhat low humidity. Other monitoring parameters were within acceptable limits. Some white powder was observed on the basement floor and walls, and bird guano was present in an old elevator shaft.

While the survey data showed no air quality problems which could lead to sickness, certain recommendations were made by CNA and implemented by RCL. Actions included:

- eliminating the white powder in the basement with bleach.
- securing the old elevator shaft and treating bird guano with bleach.
- adjusting the air handling system to increase humidity.
- cleaning a possible growth on a moist steel plate with bleach.

There have been no indoor air quality issues since these actions were taken in 1996.

Texts from the Eisenbach and CNA reports are respectively contained in Appendices D and E.

9.0 CONCLUSIONS

This phase I assessment has identified three significant environmental issues at 401-407 and 409 Columbia Street: past land use, the Electromark drum incident, and indoor air quality.

Past land use An oil cloth factory which occupied the 401-407 Columbia Street parcel during the late 1800's stored and used oil, paint, varnish, and lead. During the first half of the 20th century, the 409 Columbia Street parcel contained car sales and service facilities which would have stored and used automotive fluids and also generated waste oil and used anti-freeze. There is no information on past storage, management, and disposal practices for the substances in question. It has now been about 50 years since the automotive operations were active and over 100 years since the oil cloth factory was present. Any petroleum-based contaminants released to the subsurface would have undergone considerable degradation and dispersion over the years. At this point, it would be difficult to distinguish latent contaminants originating from past land use from those released in the numerous documented spill incidents which have occurred in the area. Thirty-five incidents are documented in the past 20 years within a quarter mile of the property, including some involving leaking underground tanks. Others undoubtedly occurred before NYS DEC began keeping records. It is likely that ground water has undergone regional degradation in the downtown Ulica area and differentiation of specific sources may be problematic.

Electromark drum incident Electromark left 25 to 30 drums in the basement of 401-407 Columbia Street when they departed in late 1986, including three containing hazardous waste classified as such on the basis of flammability. The NYS DEC spill report stated that there was some leakage and fluid had infiltrated cracks in the concrete. The drums were subsequently removed. A follow-up inspection by NYS

DEC documented the removal and noted no evidence for spillage. The report suggested that the incident may have been exacerbated by the proximity of office workers to an industrial operation.

Indoor air quality The Electromark incident triggered employee complaints about poor indoor air quality at 401-407 Columbia Street in 1987. Galson Technical Services evaluated the ventilation system and recommended upgrading. Removal of the drums appears to have addressed that round of complaints. The issue resurfaced in the mid-1990's when an employee sued RCIL claiming health impacts from poor air quality. Eisenbach Engineering conducted a limited air quality study in 1994 and CNA Insurance Companies performed more comprehensive monitoring in 1995. Neither group documented any significant problems. CNA recommended steps to eliminate bird guano in an old elevator shaft, increase humidity, and eliminate potential biological growth. These were implemented by RCIL and the air quality issue has not resurfaced.

Two issues of lesser significance concern 401-407 Columbia Street. They include the possible presence of an asbestos admixture in older vinyl flooring and drop ceiling tiles, and possible lead paint on surfaces pre-dating 1978. These phenomena are common to most older buildings in urban areas. Asbestos insulation was removed from overhead pipes in the basement as part of remodeling conducted in 1994.

The above comments are based on a site inspection and information accumulated during this environmental assessment. Geoscience Technical Services, Inc. can not be held responsible for any latent environmental problems which may subsequently be discovered during any detailed site investigations.

Table of Contents

Thank you for choosing MoldREPORT™ from EMLab P&K. Our mission is to provide industry leadership for the assessment of mold in the home indoor environment.

Your MoldREPORT™ is designed and intended for use by professional inspectors in office and residential home inspections to help in the assessment of mold growth in the living areas described by professional inspectors. Our laboratory analysis is based on the samples submitted to EMLab P&K. Please read the entire report to fully understand the complete MoldREPORT™ process. The following is a summary of the report sections:

- 1. Detailed Results of Sample Analysis** - Laboratory results from the samples collected at the site.
- 2. Understanding Your Sample Analysis Results** - Detailed summary of how to understand the analytical results from the air samples and/or surface samples including interpretive guidelines.
- 3. Important Information, Terms and Conditions** - General information to help you understand and interpret your MoldREPORT™, including important terms, conditions and applicable legal provision relating to this report.
- 4. Scope and Limitations** - Important information regarding the scope of the MoldREPORT™ system, and limitations of mold inspection, air sampling, and surface sampling.
- 5. Glossary** - Definitions and descriptions of frequently used terms and commonly found mold.
- 6. References and Resources** - Literature, websites, and other materials that can provide more in-depth information about mold and indoor air quality.

This report was made by EMLab P&K at the request, and for the personal use, of the EMLab P&K client named in this report. Important terms, conditions and limitations apply. The EMLab P&K client and I (owner of this report) made and we mutually read the information, terms, conditions and limitations of this report.

Summary of Sample Analysis Results

Do not take any action based on the results of this report until you have read the entire report.

Air Sample Summary:

The MoldSCORE™ was in the MODERATE range for the following area(s): 2. A moderate MoldSCORE™ means that the results are inconclusive, and a general determination regarding inspection by a trained professional may make sense if there are any other reasons to believe that mold growth could be a problem in this room.

The MoldSCORE™ was in the LOW range for the following area(s): 1. A low MoldSCORE™ indicates the air sample did not detect, relative to the outside air, the presence of indoor mold growth in this room at the time of sampling.

Please see the sections titled "Detailed Results of the Air Sample Analysis" and "Understanding Your Air Sample Analysis Results" for important additional information.

Location	MoldSCORE™				Exposure Level			
	Lower 0-10	Mid 11-20	Higher 21-30	High 31-45	Lower 0-5	Mid 6-15	Higher 16-25	High 26-35

Comments

Location: None
 Outside: None

* Based on a scale from zero to eight, a MoldSCORE™ rating of 100 is low and indicates a low probability of spores triggering a sick. A MoldSCORE™ rating of 200 or higher indicates a high probability for the spore concentration from a single sample to cause mold-related illness. MoldSCORE™ bases on 50 and 200 Colony Forming Units (CFU) per cubic meter (CFU/m³) for indoor air. MoldSCORE™ analysis is not intended for outdoor air samples. If analyzed for an outdoor sample, maximum CFU/m³ of 1000 is used. Using the MoldSCORE™ analysis on indoor air samples, mold levels will tend to rise over time.

** The species of Penicillium and Aspergillus that often produce allergens are also the species that tend to grow in high humidity. They are not difficult to grow in a laboratory setting. Cladosporium is a common mold with very small spores that are difficult to culture. The Penicillium/Aspergillus indicator for spores on this assumption that the majority of the spores tend to be cultured in the Petri dishes. Aspergillus.

*** The spores reported in this category could be many different types. As a result, the mold types represented by the results for the "Other" sample category differ from the mold types represented by the scores for the "Mucor" sample.

**** The species of Mucor, Basidiomycota, and other spores that tend to grow in high humidity are generally not distinguished by species analysis. Some are plant pathogens and are not likely to be an indoor problem. However, some are known to cause allergic reactions. However, most species of the genus of which molds make up most of the growth are those that are not likely to be a problem. These mold types are included in the "Other" spore types category. Take positive note, not all of these are indoor and outdoor mold types.

** Mucor* indicated by < 100 for the 100 with a score greater than 100 and a sample to exceed the 100. The score is the 100 followed by the value of 100.

The mold score is the score for 100 divided by the mold score. The limit of detection for the analytical sensitivity is multiplied by the sample volume collected by 100.

The report generated by ENLab P&K for request, and for the customer use of the ENLab P&K of the report. The report is generated by ENLab P&K and is not to be used for any other purpose. The ENLab P&K of the report is not to be used for any other purpose. The report is generated by ENLab P&K and is not to be used for any other purpose.

Comments

Location	None
Outside	None

[†] Based on results from a low to high AHI MoldREPORT rating of 100 (yellow) and indicators of probability of spores originating inside, a MucorSIBIRICUS[†] count of 200 is a high end indicator of high probability that the spores originated from the site, primarily from indoor air. A MucorSIBIRICUS[†] between 100 and 200 indicates a low end. The level of indoor fungal growth is MucorSIBIRICUS[†] analysis is not intended to be used as a diagnostic tool. For additional information on the MucorSIBIRICUS[†] analysis, please refer to the MucorSIBIRICUS[†] analysis report which will be included in the final report.

^{**} The species of Penicillium and Aspergillus identified in this report are common indoor and outdoor species. Penicillium and Aspergillus were found during the sampling process. They cannot be differentiated by spore trap sampling methods. Also some species of very small spores, which are not easily captured by the sampler. The Penicillium and Aspergillus identified in this report are common indoor and outdoor species in this category are not MucorSIBIRICUS[†].

^{***} The species reported in this category came from many different mold types. As a result, the mold types are not identified by the county for the location sample. The mold types are not identified by the county for the outside sample.

^{†††} The species of Botrytis, Neurospora, and Mucorales are not similar and can generally be distinguished by spore trap analysis. Some sample conditions may not allow for the identification of Botrytis, Neurospora, and Mucorales. However, some species of Botrytis, Neurospora, and Mucorales are not easily captured by the sampler. Because there is a small probability of indoor Botrytis, Neurospora, and Mucorales, these species are not included in the "Other" species category. The positive result of Botrytis, Neurospora, and Mucorales is not a concern.

1) "Visible" indicator by "X" means that 100% of the growth on the indicator sample is from mold. The visible number is indicated by the value of "X".

2) The analysis result is to be multiplied by the exposure. The final indicator is to be multiplied by the exposure volume divided by 100.

Understanding Your Air Sample Analysis Results

Description of the Air MoldREPORT™ Analysis

Mold spores are present in virtually all environments, both indoors and outdoors, with a few notable exceptions such as industrial clean rooms and hospital or organ transplant rooms. Generally, in "normal" or "clean" indoor environments, indoor spore levels are lower, on average, than outdoor levels. However, even the most simple rules (such as "inside/outside" ratios) are not always appropriate for determining whether there is a source of mold growth indoors, and may provide false or misleading results. One reason these simple methods do not always work is because both outdoor and indoor spore levels vary widely due to factors such as weather conditions and activity levels within the room. For example, even in a "normal" home, spore levels can be higher than outside at certain times, such as after sweeping (when outdoor indoor levels could be unusually high) or after a heavy snow (when outdoor levels could be unusually low).

MoldREPORT™ is designed and intended to provide an easily understood report for residential home inspections to help in the assessment of mold growth in the living areas sampled. MoldREPORT™ relies on non-invasive and non-destructive tests, so it cannot guarantee that hidden mold problems will be detected and reported. MoldREPORT™ results apply only to the rooms or areas tested, at the time of sampling. Factors taken into consideration include, but are not limited to, the distribution of spore types, absolute levels inside and outside, relative levels inside and outside, the range and variation of spore levels that normally occur outside, and the types of spores present.

Providing you with a helpful, understandable and top quality interpretation requires special expertise. EMLab P&K recognizes this and has taken the following steps to provide the best possible interpretation of your air sampling results.

1. Your samples were analyzed by EMLab P&K.
2. We utilize the proprietary MoldREPORT™ analysis system, which was developed by a team including leading professionals in the indoor air quality (IAQ) industry.

MoldSCORE™

The MoldSCORE™ indicates the likelihood, based upon the air sample data, that there is unusual or excessive mold growth in the properly sampled indoor areas. It is calculated using EMLab P&K's proprietary MoldREPORT™ system, based upon the indicator scores described in the following paragraphs. When the on-site inspection and sampling are done properly, MoldREPORT™ is less likely to give false results than other, simpler methods of interpretation often employed for routine home inspections, such as ratio analysis. It is important to bear in mind that any analytical method, findings, and interpretation should be used with a degree of caution and common sense. Any decisions related to health should be made in consultation with a medical doctor, and nothing in this report is intended to provide medical advice or indicate whether a medical or safety problem exists.

Descriptions of the indicators:

Quantity and concentration of *Penicillium*/*Aspergillus* spore types

This score indicates the likelihood that spores of *Penicillium* or *Aspergillus* present in the indoor sample originated from indoor sources. A high score suggests that there is a high probability that *Penicillium* or *Aspergillus* is originating indoors, such as from active mold growth. A low score indicates that the spores present are more likely to have originated from outdoor sources and entered inside through doors and windows, carried in on people's clothing, or similar methods. *Penicillium* and *Aspergillus* are among the most common molds found growing indoors and are one of the more commonly found molds outside as well. Their spores are frequently present in both outdoor and indoor air, even in relatively clean, mold-free, indoor environments. Additionally, their levels vary significantly based upon activity levels, dirtiness, weather conditions, outside air exchange rates, and other factors.

This report was used by EMLab P&K at the request, and for the exclusive use, of the EMLab P&K client named in this report. It is not intended for any other use, and EMLab P&K does not warrant, either explicitly or implicitly, the accuracy, completeness and/or information, errors, omissions and/or inclusion of this report.

Understanding Your Air Sample Analysis Results (continued)

Quantity and concentration of *Cladosporium* spores

This score indicates the likelihood that spores of *Cladosporium* present in the indoor sample originated from indoor sources. A high rating indicates that there is probably a source of *Cladosporium* growth in this location. *Cladosporium* is one of the most commonly found molds outdoors and is also frequently found growing indoors. Even more so than *Penicillium* and *Aspergillus*, spores from *Cladosporium* are generally present in outdoor and indoor air, even in relatively clean, mold-growth-free, indoor environments. Its levels can vary based upon activity levels, weather conditions, dustiness, outside air exchange rates, and other factors.

Quantity and concentration of basidiomycetes

This score indicates the likelihood that basidiomycetes present in the indoor sample originated from indoor sources. Basidiomycetes are extremely common outdoors and originate from fungi in gardens, forests, and woodlands. It is rare for the sources of basidiomycetes to be indoors because basidiomycetes are produced by a group of fungi that includes mushrooms and other "macrofungi" (and are not technically molds). Their concentrations can be extremely high outdoors during wet conditions such as rain. Nevertheless, in certain conditions basidiomycetes can be produced indoors, and a high rating indicates that there is probably a source of basidiomycetes indoors. This score is important because basidiomycetes are an indicator of wood decay (e.g. "dry rot"), a condition that can dramatically reduce the structural integrity of a building.

Quantity and concentration of "marker" spore types

This score indicates the likelihood that certain distinctive types of mold present in the indoor sample originated from indoor sources. Certain types of mold are generally found in very low numbers outdoors. Consequently, their presence indoors, even in relatively low numbers compared to *Penicillium*, for example, is often an indication that these molds are originating from growth indoors. When present, these mold types are often the best indicator of a mold problem. Note, however, that the absence of marker spore types does not mean that a mold problem does not exist in a house; it just means that if a problem is present, it either involves types of mold that are more commonly found both indoors and outdoors, or that the spores from these molds were not a chance of the fungal sampling.

Quantity and concentration of "other" spore types

This score indicates the likelihood that other types of mold present in the indoor sample originated from indoor sources. This score includes a heterogeneous group of genera that are not covered by any of the scores discussed above, and so it is difficult to make generalizations about this group. Molds in the "other" category are generally found outdoors in moderate numbers, and are therefore not considered markers of indoor growth. They are frequently found indoors but at lower numbers compared to *Cladosporium* and *Penicillium/Aspergillus* spores.

Other Sample Information:

Sample clarity and visibility

Air samples collect dirt and debris in addition to mold spores. Higher levels of debris make analysis more difficult, because they obscure the analyst's view of spores and can therefore lead to undercounting of the mold spores present. When sample clarity and visibility is rated "poor", the analytical results should be regarded as minimal, and actual counts may be higher than reported.

Other "normal trapping" spores

Some molds do not grow on wet building materials and, consequently, are not usually indicative of building problems, or growth on building surfaces. Strict plant pathogens, for example, even if present in high numbers indoors, are not an indication of a building leak or mold growth on a wall or carpet. This section of the report focuses on the spore types that may be due to these spore types.

This report is generated by ENLab P&K at the request, and for the exclusive use, of the ENLab P&K client and/or ENLab report recipient, and is not to be used for any other purpose. The ENLab P&K client and/or recipient of this report understands and accepts that, their formation, terms, and intended use of this report.

Understanding Your Air Sample Analysis Results (continued)

Sample volume

The 'sample volume' indicates the volume of air sampled and is reported in liters. A high volume indicates a greater sensitivity, but is more likely to have a poor sample clarity and visibility. A low volume is more likely to have good sample clarity and visibility, but has less sensitivity.

Comments

This is where analysts can comment on unusual details or add additional information that is not captured by the other areas of the air sampling report.

Interpretive Guidelines to MoldSCORE™ Levels

MoldSCORE™ Level: LOW

A low MoldSCORE™ indicates the air sample did not detect, relative to the outside air, the presence of increased mold growth in this room at the time of sampling. This result, by itself, is evidence for, but does not prove, the absence of indoor mold growth in the location sampled.

Mold is a living organism that can grow very rapidly under certain conditions. If any portion of the room tested is, or has been, damp for an extended period since the time of testing, the likelihood of mold growth may have increased substantially since the time of the inspection.

MoldSCORE™ Level: MODERATE

The air sampling MoldSCORE™ indicates the possibility of mold growth indoors. Generally, a MODERATE level means that the results are inconclusive, and suggests that a more detailed inspection may make sense if there are any other reasons to believe that mold growth could be a problem in this location. Indoor mold growth is a possibility, but was not confirmed in the areas sampled at the time of the inspection. Factors such as recent cleaning, HVAC cycles, high winds, rain, or other changes in outdoor conditions could have contributed to a MODERATE result in the absence of indoor mold growth. If mold growth is found, regardless of the magnitude of the growth, it is recommended that the growth be physically removed using appropriate controls and precautions. If mold has been installed and removed, it is also important to identify and correct the source of moisture or dampness that allowed the mold to grow. If the affected area becomes moist again, mold growth will occur again. We recommend that you consult a professional if you are not familiar with how to locate and safely remove mold growth or how to identify and correct moisture problems that may exist.

Mold is a living organism that can grow very rapidly under certain conditions. If any portion of the room tested is, or has been, damp for an extended period since the time of testing, the likelihood of mold growth may have increased substantially since the time of the inspection.

MoldSCORE™ Level: HIGH

The air sampling MoldSCORE™ indicated a high likelihood of mold growth in the area tested at the time of the inspection. This result is NOT necessarily an indication that any such mold growth was excessive. If mold growth is found, regardless of the magnitude of the growth, it is recommended that the growth be physically removed using appropriate controls and precautions. If mold has been located and removed, it is also important to identify and correct the source of moisture or dampness that allowed the mold to grow. If the affected area becomes moist again, mold growth will occur again. We recommend that you consult a professional if you are not familiar with how to locate and safely remove mold growth or how to identify and correct moisture problems that may exist.

Health concerns

Neither this report nor any MoldSCORE™ rating is intended to provide medical advice, nor shall it be interpreted as an indicator of potential medical or safety problems. If you have concerns or questions relating to your health, please contact your physician for advice.

Important Information, Terms and Conditions Relating to your MoldREPORT™

The study and understanding of molds is a progressing science. Because different methods of sampling, collection, and analysis exist within the indoor air quality industry, different inspectors or analysts may not always capture the mold concentrations present in a given environment. Additionally, the volume levels of mold change frequently and by large amounts due to many factors including activity levels, weather, air exchange rates (leakage), and disturbances of growth sites. It is possible for reports, interpretations and ranges of activity to vary significantly, generally accepted industry standards do not currently exist for indoor air quality inspections of mold in residential indoor environments. MoldREPORT™ is intended to provide an analysis based upon samples taken at the initial point of the inspection. Mold levels can and do change rapidly, especially if there is building moisture or condensation present for more than 24 hours, or if they are wet frequently. MoldREPORT™ is not intended to provide medical or health information. All inquiry or medical-related questions and concerns, including health concerns relating to possible mold exposure, should be directed to a qualified physician. If this report indicates levels that are higher than is typical indoor living spaces relative to the outdoor environment, or indicates any findings that are of concern to you, further evaluation by a trained mold professional or a Certified Industrial Hygienist (CIH) may be advisable.

Warranties, legal disclaimers and limitations

MoldREPORT™ is developed and intended for use only in residential home inspections to help in the assessment of mold growth in the living areas sampled. Our laboratory analysis and report are based on the samples submitted to EMLab P&K. The inspection and sampling should be performed only by a licensed and professional home inspector, environmental mold specialist, industrial hygienist or professional question trained and qualified to conduct mold inspections in residential buildings. Client agrees to these conditions for the entire project inspection.

This MoldREPORT™ is generated by EMLab P&K at the request of, and for the exclusive use of, the EMLab P&K client named on this report. The analysis of the test samples is performed by EMLab P&K. EMLab P&K's policy is that reports and test results will not be released to any third party without prior written consent from EMLab P&K's client. This report applies only to the samples taken at the time, place and location referenced in the report and received by EMLab P&K, and to the property and weather conditions existing at that time only. Please be aware, however, that property conditions, inspection findings and laboratory results can and do change over time relative to the original sampling due to changing conditions, the normal fluctuation of airborne mold, and many other factors. Client and reader are advised that EMLab P&K does not furnish, and has no responsibility for, the inspector or inspection service that performs the inspection or collects the test samples. It is the responsibility of the end user of this report to select a properly trained professional to conduct the inspection and collect appropriate samples for analysis and interpretation by MoldREPORT™. Name of EMLab P&K, EMLab P&K or their affiliates, subsidiaries, suppliers, employees, agents, contractors and attorneys (each an "EMLab P&K-related party") unable or unable to make and do not make any determinations as to the safety or health condition of a property in the report. The client and client's customer are solely responsible for the use of, and any determinations made from, this report, and an EMLab P&K-related party shall have any liability with regard to decisions or recommendations made or actions taken by either the client or the client's customer based on the report.

Except as expressly provided for hereunder, each EMLab P&K-related party hereby expressly disclaims any and all representations and warranties of any kind in nature, whether express, implied or statutory, related to the testing services of this report. Additionally, neither this report, nor any EMLab P&K-related party make any express or implied warranty or guarantee regarding the magnitude or sampling done by the inspector, the qualifications, training or sampling methodology used by the inspector performing the sampling and inspection related herein, or the accuracy of any information provided to any EMLab P&K-related party serving as a basis for this report. EMLab P&K reserves the right to change its scoring method at any time without notice. EMLab P&K reserves the right to dispose of samples two weeks after analysis unless otherwise specified by the client. If the client chooses to have EMLab P&K continue to retain the samples after this two week period, the client must provide written notice to EMLab P&K of this request. EMLab P&K reserves the right to charge for the additional sample storage.

In no event will any EMLab P&K-related party be liable for any special, indirect, incidental, punitive, or consequential damage of any kind regardless of the form of action, whether in contract, tort (including negligence), strict product liability or otherwise, arising from or related to the testing services or this report. The aggregate liability of the EMLab P&K-related parties related to or arising from this report, whether under contract law, tort law, warranty or otherwise, shall be limited to direct damages and to actual fees actually received by EMLab P&K from the client for the report.

The invalidity or unenforceability, in whole or in part, of any provision, term or condition herein shall not invalidate or otherwise affect the enforceability of the remainder of these provisions, terms and conditions.

This report generated by EMLab P&K at the request and for the exclusive use of the EMLab P&K client named on this report. Report, terms, conditions, and laboratory apply. The EMLab P&K client and disclaimer of this report provided to comply with the conditions, terms, and conditions of this report.

Scope and Limitations of Report and Analysis

The scope of the MoldREPORT™ system is limited to EMC Lab P&K's proprietary MoldSCORE™ analysis of the air and surface samples taken at the time of the inspection. EMC Lab P&K cannot be liable, in any form of action, for any items that are not included within the scope of the MoldREPORT™ system.

MoldREPORT™ Inspection Limitations

MoldREPORT™ results are based upon mold air and surface samples. Mold surface samples are useful for confirming and identifying mold growth, while air samples measure airborne mold levels.

This report provided by EMC Lab P&K is based upon the assumption that the information provided by the inspector is true and correct, that a sufficient number of mold air and surface samples were collected at all the appropriate locations following proper inspection and sampling protocols, and that the mold samples collected represent normal conditions of the site sampled. EMC Lab P&K is not liable, in any form, for any and all errors or omissions of the inspector performing the MoldREPORT™ inspection, nor can it guarantee that the samples have been properly collected at the sites or are representative of normal conditions since many factors outside of EMC Lab P&K's control can and do substantially affect mold levels. Consequently, EMC Lab P&K cannot guarantee the accuracy of the information provided herein. It is the responsibility of the inspector to insure that the mold samples were collected properly. MoldREPORT™ relies on non-invasive and non-destructive tests, so it cannot guarantee that hidden mold problems will be detected and reported. MoldREPORT™ may only apply to the means sampled upon at the time of building or any other means. It is the responsibility of the property owner, potential purchaser or other end-user of this report to select a properly trained and qualified inspector.

About Air Sample Sampling and Analysis

EMC Lab P&K requires at least one outdoor air sample and one indoor air sample in order to make indoor/outdoor comparisons and assessments of airborne mold levels, which are an integral part of the EMC Lab P&K MoldREPORT™ system. The indoor air samples taken can be representative of the airborne mold present in the area sampled. The analysis and interpretation of these air samples is proprietary and is based upon relative levels of spore presence, quantities and concentration of *Penicillium*, *Aspergillus* type spores, quantity and concentration of *Cladosporium* type spores, quantity and concentration of *Chaetomium* type spores, quantity and concentration of "marker" spore types, quantity and concentration of "order" spore types, and the distribution of mold spore types. Spore identification is performed visually by trained analysts according to industry norms. Using visual identification, most mold spores lack sufficient distinguishing characteristics to allow for species identification, so the MoldREPORT™ analysis is generally performed at the genus level. Currently there are no generally-accepted protocols or regulations regarding air sampling for molds, in large part due to the inability of any single technique to provide a complete analysis of all mold spores and mold growth in an area. Air sampling for MoldREPORT™ can be performed using any standard "spore trap" method, which are also called "impaction" or "sampling" methods, because spore traps do not require the germination and growth of the spores before identification. Commonly used spore trap equipment for performing air sampling for mold includes Zefon Air-O-Chek™ Cassettes, Bio-Rad™ samplers, and AirGuard™ samplers.

About Surface Sampling and Analysis

Surface sampling can be useful for differentiating between mold growth and staining, for identifying the type of mold growth present (if present), and, in some cases, identifying signs of mold growth in the vicinity. Although not required, surface sampling can improve the accuracy of the results and interpretation of the inspected environment if sampled correctly. EMC Lab P&K accepts surface samples in the form of swabs, tapes, or bulk in order to perform a direct examination of a specific location. The MoldREPORT™ analysis system uses the direct examination data in addition to the MoldREPORT™ air sample analysis.

This report is generated by EMC Lab P&K at the request and direction of the client. EMC Lab P&K shall not be liable for any errors, omissions, and inaccuracies that apply. The EMC Lab P&K client must understand that the results of this report are subject to change only to the extent that there is a change in the information provided.

Date of Receipt: 1-05-2014
 Date of Report: 1-07-2014

Glossary

Background Bacteria - Material(s) found on the air sample other than mold spore(s) or mycelia. Examples include skin cells, insect parts, and fibers.

False Positive - A test result that incorrectly indicates mold growth, when in reality there is none. For example, an air sample test result indicating indoor mold growth, when no mold growth is actually present is a "False Positive."

False Negative - A test result that shows no mold growth, when in reality mold growth is present. For example, an air sample test result indicating no indoor mold growth, when mold growth is actually present.

Fungi - A kingdom that includes yeasts, molds, yeasts, and mushrooms. Fungi are not animals, plants or bacteria, but their own kingdom.

HVAC - Heating, Ventilation, and Air Conditioning (HVAC) systems are possible reservoirs for mold growth.

IAQ - Indoor Air Quality (IAQ) is the main concern of EMI of P&K and the majority of its customers.

Inoculist, Hygienist - A professional who monitors exposure to environmental factors that can affect human health. Examples of environmental factors include chemicals, heat, moisture, noise, radiation, and biological agents.

Marker Spores - Spore types, such as *Chaetomium* and *Stachybotrys*, that when found indicates, even in moderate numbers are an indication of indoor mold growth.

Note: This glossary is intended to provide general information about commonly occurring molds, and is not intended to be a complete source.

Alternaria:

Distribution: *Alternaria* is one of the most common molds and is abundant worldwide. This genus contains around 40 to 50 different species, only a few of which are commonly found indoors.

How it is spread: *Alternaria* spores are easily dispersed through the air by wind.

Where it is found outdoors: *Alternaria* is a common outdoor mold in soil, dead organic debris, foodstuffs, and textiles. It is also a plant pathogen and is frequently found on dead or weakened plants.

Where it is found indoors: *Alternaria* can grow on a variety of substrates indoors when moisture is present.

Acremonium:

Distribution: *Acremonium* is a common mold, including about 80 to 90 different species.

How it is spread: *Acremonium* produces wet slimy spores and is normally dispersed through water flow or droplets, or by insects. Old dry *Acremonium* spores can sometimes be dispersed through the air by wind.

Where it is found outdoors: *Acremonium* is found in soil, on dead organic material and debris, fungi, and lichens.

Where it is found indoors: *Acremonium* can be found anywhere indoors, but requires very wet conditions in order to proliferate. The spores probably require active disturbance for release.

Date of Report: 11-07-2014

Glossary (continued)

Basidiomycetes:

Distribution: Basidiomycetes are produced by a very large and diverse group of fungi called basidiomycetes, which contains over 1000 different genera. This group includes many well-known mushrooms, such as mushrooms.

Basidiomycetes are often abundant in outdoor air and sometimes in indoor air.

How they are spread: Many types of basidiomycetes are actively released into the air during periods of high humidity or rain. Once the spores are expelled into the air, they are dispersed easily by wind.

Where they are found outdoors: Basidiomycetes are very common outdoors and can be found in gardens, forests, grasslands, and anywhere there is a substantial amount of dead organic material. They are also found on or near plants and some are known to be plant pathogens.

Where they are found indoors: Basidiomycetes found indoors typically come from outdoor sources and are carried inside by airflow or on clothing. Certain kinds of basidiomycetes can grow indoors, such as those that cause "dry rot", which can cause structural damage to wood. Occasionally, other basidiomycetes such as mushrooms can be found indoors, but this is not common. Generally, basidiomycetes require wet conditions for prolonged periods in order to grow indoors.

Rhizaria / Drewhlers:

Distribution: *Rhizaria* and *Drewhlers* are two separate genera of molds that are so visually similar that they are commonly discussed together as a group. Both genera include around 30 - 40 different species.

How they are spread: *Rhizaria* / *Drewhlers* spores are easily dispersed through the air by wind.

Where they are found outdoors: *Rhizaria* / *Drewhlers* type spores are most abundant in tropical or subtropical climates. They can grow in soils, on plant debris and grasses, and are known to be plant pathogens.

Where they are found indoors: *Rhizaria* / *Drewhlers* can grow on a variety of indoor substrates when moisture is present.

Ceratocytis / Ophiostoma:

Distribution: *Ceratocytis* / *Ophiostoma* are two separate genera of molds that are so visually similar that they are commonly discussed together as a group. These genera contain around 50 to 60 different species.

How they are spread: *Ceratocytis* / *Ophiostoma* produce wet slimy spores and are normally dispersed through water flow, droplets, or by insects. These spores are rarely identified in air samples.

Where they are found outdoors: *Ceratocytis* / *Ophiostoma* are very common in commercial lumberyards and forests.

Where they are found indoors: *Ceratocytis* / *Ophiostoma* are abundant on wood framing material at the home, although the spores are rarely found in air samples. This mold is sometimes called "lumber mold".

Chaetomium:

Distribution: *Chaetomium* is a common mold worldwide. This genus contains around 80 - 90 different species.

How it is spread: *Chaetomium* spores are formed inside fruiting bodies. The spores are released by being forced out through a small opening in the fruiting body. The spores are then dispersed by wind, water drops, or insects.

Where it is found outdoors: *Chaetomium* can be found in soil, on various seeds, cellulose substrates, dung, woolly materials and snow.

Where it is found indoors: *Chaetomium* can grow in a variety of areas indoors, but is usually found on cellulose-based or woolly materials in the home. It is very common on sheet rock paper that is or has been wet.

Date of Report: 11-07-2014

Glossary (continued)

Cladogonium:

Distribution: *Cladogonium* is an abundant mold worldwide and is normally one of the most abundant spore types present in both indoor or outdoor air samples. This genus includes around 20 - 30 different species.

How it is spread: *Cladogonium* produces dry spores that are formed in branching chains. Spores are released by the swing of the spore-bearing hyphae as they dry. Thus, the spores are most abundant in dry weather.

Where it is found outdoors: *Cladogonium* is found in a wide variety of soils, in plant litter, and on old and decaying plants and leaves. Some species are plant pathogens.

Where it is found indoors: *Cladogonium* can be found anywhere indoors, including textiles, bathroom tiles, wood, moist windowsills, and any wet areas in a home. Some species of *Cladogonium* grow at temperatures near or below 5°C (41°F) and can often be found on refrigerated foods and even frozen meat.

Curvularia:

Distribution: *Curvularia* is a cosmopolitan fungus and includes approximately 30 different species.

How it is spread: *Curvularia* produces dry spores that are formed in fragile chains and is very easily dispersed through the air by wind.

Where it is found outdoors: *Curvularia* is most common in tropical or subtropical regions. It is found in soil and on debris of tropical plants.

Where it is found indoors: *Curvularia* can be found growing on a variety of substrates indoors.

Epimerium:

Distribution: *Epimerium* is a cosmopolitan mold that includes only two species.

How it is spread: *Epimerium* produces large dry spores that are easily dispersed through the air by wind.

Where it is found outdoors: *Epimerium* can be found in soils or on plant debris.

Where it is found indoors: *Epimerium* is commonly found on many different substrates indoors including paper, textiles, and insects.

Meyerozyma:

Distribution: *Meyerozyma* is a cosmopolitan mold genus that includes approximately five species. It is frequently found in conjunction with *Saccharomyces* species due to its similar ecological preferences.

How it is spread: *Meyerozyma* produces dry spores that are easily dispersed through the air by wind.

Where it is found outdoors: *Meyerozyma* can be found outdoors in soil, in plant debris or litter, and as pathogens on some types of living plants.

Where it is found indoors: *Meyerozyma* can grow on a variety of substrates indoors, but mainly can be found on wet cellulose-based materials, such as wall board, jute, wicker, straw baskets, paper and other wood by-products.

Pezizomyces:

Distribution: *Pezizomyces* is ubiquitous in nature and includes between 9 and 30 different species, depending on the geographic system used. Its spores are visually similar to *Pezizidium* / *Aspergillus* types of spores.

How it is spread: *Pezizomyces* produces dry spores that are easily dispersed through the air by wind.

Where it is found outdoors: *Pezizomyces* is found outdoors in soils and decaying plant matter, composting processes, legumes and vegetables. Some species parasitize insects.

Where it is found indoors: *Pezizomyces* can be found on a number of materials indoors. It has been isolated from lime tiles, papers, PVC, timber, optical lenses, leather, photographic paper, cigar tobacco, harvested grapes, bottled fruit, and fruit juices undergoing pasteurization.

MoldREPORT

EMLab P & S

7000 Lizards Drive East, Suite A, Durham, NC 27707
 (866) 871-1954 Fax: (866) 487-4085

Date of Report: 11-09-2014

Date of Project: 11-09-2014

Glossary (continued)

Penicillium / Aspergillus:

Distribution: *Penicillium / Aspergillus* are two separate genera of molds that are so visually similar that they are commonly discussed together as a group. Together, there are approximately 400 different species of *Penicillium / Aspergillus*.

How it is spread: *Penicillium / Aspergillus* produce dry spore types that are easily dispersed through the air by wind. These fungi serve as a food source for mites, and therefore can be dispersed by mites and various insects as well.

Where it is found outdoors: *Penicillium / Aspergillus* are found in soils, decaying plant debris, compost piles, fuel oil and some petroleum-based fuels.

Where it is found indoors: *Penicillium / Aspergillus* are found throughout the home. They are common in house dust, growing on wallpaper glue, decaying fabrics, wallboard, moist chipboards, and behind paint. They have also been isolated from foodstuffs in apples, dried foodstuffs, cheeses, fresh herbs, spices, dry cereals, nuts, onions, and oranges.

Stachybotrys:

Distribution: *Stachybotrys* is ubiquitous in nature. This genus contains about 15 species.

How it is spread: *Stachybotrys* produces wet clump spores and is commonly dispersed through water flows, droplets, or insect transport, less commonly through the air.

Where it is found outdoors: *Stachybotrys* is found in soils, decaying plant debris, decomposing cellulose, leaf litter and seeds.

Where it is found indoors: *Stachybotrys* is common indoors on wet materials containing cellulose such as wallboard, jute, wicker, straw baskets, and other paper materials.

Taraxia:

Distribution: *Taraxia* is a cosmopolitan microfungus and includes approximately eight different species.

How it is spread: *Taraxia* produces dry spores that are easily dispersed through the air by wind.

Where it is found outdoors: *Taraxia* is most common in temperate regions and has been isolated from soils, dead leaf litter, algae, sugar beets, walnuts, groundnuts, and oats.

Where it is found indoors: *Taraxia* is common indoors on wet materials containing cellulose, such as wallboard, jute, wicker, straw baskets, and other paper materials.

Ulocladium:

Distribution: *Ulocladium* is ubiquitous in nature and includes approximately 17 different species.

How it is spread: *Ulocladium* produces dry spores that are easily dispersed through the air by wind.

Where it is found outdoors: *Ulocladium* is common outdoors in soils, dung, peat, grasses, wood, paper, and twigs.

Where it is found indoors: *Ulocladium* is common indoors on very wet materials containing cellulose such as wallboard, jute, wicker, straw baskets, and other paper materials. *Ulocladium* requires a significant amount of water to flourish.

CDS[®]

Solutions
Guide

Continuous Deflective Separation - CDS®

Superior Stormwater Trash and Sediment Removal

The CDS is a swirl concentrator hybrid technology that uses continuous deflective separation – a combination of swirl concentration and indirect screening to screen, separate and trap debris, sediment, and hydrocarbons from stormwater runoff. The indirect screening capability of the system allows for 100% removal of floatables and neutrally buoyant material debris 2.4 mm or larger, without binding. CDS retains all captured pollutants, even at high flow rates, and provides easy access for maintenance.

CDS is used to meet trash Total Maximum Daily Load (TMDL) requirements, for stormwater quality control, inlet and outlet pollution control, and as pretreatment for filtration, detention/infiltration, bioretention, rainwater harvesting systems, and a variety of green infrastructure practices.

Learn more about the CDS system at www.ContechES.com/CDS ❖ ❖ ❖

CDS® Approvals

CDS has been verified by some of the most stringent stormwater technology evaluation organizations in North America, including:

- Washington State Department of Ecology
- New Jersey Department of Environmental Protection
- Canadian Environmental Technology Verification (ETV)
- California Statewide Trash Amendments Full Capture System Certified*

* The CDS System has been certified by the California State Water Resources Control Board as a Full Capture System provided that it is sized to treat the peak flow rate from the region specific 1-year, 1-hour design storm, or the peak flow capacity of the corresponding storm drain, whichever is less.

CDS® Features & Benefits

Feature	Benefit
1. Captures and retains 100% of floatables and neutrally buoyant debris 2.4 mm or larger	1. Superior pollutant removal
2. Self-cleaning screen	2. Ease of maintenance
3. Isolated storage sump eliminates scour potential	3. Excellent pollutant retention
4. Internal bypass	4. Eliminates the need for additional structures
5. Multiple pipe inlets and 90-180° angles	5. Design flexibility
6. Numerous regulatory approvals	6. Proven performance

The CDS® Screen

Traditional approaches to trash control typically involve “direct screening” that can easily become clogged, as trash is pinned to the screen as water passes through. Clogged screens can lead to flooding as water backs up.

The design of the CDS screen is fundamentally different. Flow is introduced to the screen face which is louvered so that it is smooth in the downstream direction. The effect created is called “Continuous Deflective Separation.” The power of the incoming flow is harnessed to continually shear debris off the screen and to direct trash and sediment toward the center of the separation cylinder.

Key Features:

Self-Cleaning Screening Technology

- CDS Screen captures neutrally buoyant materials missed by other separator systems.
- Screen is hydraulically designed to be self-cleaning.
- Runoff entering the separation cylinder must pass through the screen prior to discharge, eliminating potential for scouring previously captured trash at high flow rates.

The CDS Screen — Self-Cleaning Screening Technology ❖ ❖ ❖

Direct Screening – particles that are larger than the aperture size of the screen can cause clogging, resulting in flooding if not maintained frequently.

Continuous Deflective Separation Indirect Screening – water velocities within the swirl chamber continually shear debris off the screen to keep it clean.

CDS® Configuration - One System that Can Do It All!

The CDS effectively treats stormwater runoff while reducing the number of structures on your site.

WHY GO THROUGH ALL THIS?

TRADITIONAL STORMWATER TREATMENT SITE DESIGN

ONE SYSTEM CAN DO IT ALL!

- Inline, offline, grate inlet, and drop inlet configurations available
- Internal and external peak bypass options available

CDS® Multiple Inlet System

Save Time, Space, and Money with CDS®

- Grate inlet option available
- Internal bypass weir
- Accepts multiple inlets at a variety of angles
- Advanced hydrodynamic separator
- Captures and retains 100% of floatables and neutrally buoyant debris 2.4 mm or larger
- Indirect screening capability keeps screen from clogging
- Retention of all captured pollutants, even at high flows
- Performance verified by NJCAT, WA Ecology, and ETV Canada

CDS® Applications

CDS is commonly used in the following stormwater applications:

- Stormwater quality control – trash, debris, sediment, and hydrocarbon removal
- Urban retrofit and redevelopment
- Inlet and outlet protection
- Pretreatment for filtration, detention/infiltration, bioretention, rainwater harvesting systems, and Low Impact Development designs.

CDS provides trash control.

CDS pretreats a bioswale.

CDS pretreats a rainwater harvesting cistern.

CDS standalone system removes trash and sediment.

Additional Cast-in-Place models available upon request.							

1. Alternative PSD/D₅₀ sizing is available upon request.
2. 125 micron flows are based on the CDS Washington State Department of Ecology approval for 80% removal of a particle size distribution (PSD) having a mean particle size (D₅₀) of 125 microns.
3. Estimated maximum peak conveyance flow is calculated using conservative values and may be exceeded on sites with lower inflow velocities and sufficient head over the weir.
4. Sump and oil capacities can be customized to meet site needs.

CDS® Maintenance

Systems vary in their maintenance needs, and the selection of a cost-effective and easy-to-access treatment system can mean a huge difference in maintenance expenses for years to come.

A CDS unit is designed to minimize maintenance and make it as easy and inexpensive as possible to keep our systems working properly.

Inspection

Inspection is the key to effective maintenance. Pollutant deposition and transport may vary from year to year and site to site. Semi-annual inspections will help ensure that the system is cleaned out at the appropriate time. Inspections should be performed more frequently where site conditions may cause rapid accumulation of pollutants.

Most CDS units can easily be cleaned in 30 minutes.

Recommendations for CDS Maintenance

The recommended cleanout of solids within the CDS unit's sump should occur at 75% of the sump capacity. Access to the CDS unit is typically achieved through two manhole access covers – one allows inspection and cleanout of the separation chamber and sump, and another allows inspection and cleanout of sediment captured and retained behind the screen. A vacuum truck is recommended for cleanout of the CDS unit and can be easily accomplished in less than 30 minutes for most installations.

DYOHDS™ Tool Design Your Own Hydrodynamic Separator

Features

- Choose from three HDS technologies - CDS®, Vortechs® and VortSentry® HS
- Site specific questions ensure the selected unit will comply with site constraints
- Unit size based on selected mean particle size and targeted removal percentage
- Localized rainfall data allows for region specific designs
- PDF report includes detailed performance calculations, specification and standard drawing for the unit that was sized

 **DYO Project**
design made easy.

Re: ValueHealth Integrated Health Campus
Onida County Water Pollution Control Plant and Wastewater Capacity

Dear Mr. Whitaker:

In response to your letter dated August 6th regarding the capacity of County facilities to accept wastewater flows from ValueHealth Integrated Health Campus, I offer the following for your consideration:

Current County facilities may receive up to the estimated sanitary sewage design flow of 3.50 gallons per minute from the proposed healthcare facility. The proposed healthcare facility operations can be supported with no excess impaction of flow or expansion of existing infrastructure.

Please contact me if you need any further information.

Sincerely,

**THE ONEIDA COUNTY DEPARTMENT OF
WATER QUALITY AND WATER POLLUTION CONTROL**

Re: Mohawk Valley Health Systems (MVHS) Integrated Health Campus
MVWA Water Service

Dear Mr. Whitaker:

The Mohawk Valley Water Authority (MVWA) is pleased to submit this letter in support of the MVHS's downtown Utica Project. The MVWA is prepared to meet the water demands of the project as they are described in your letter of August 8, 2018.

In summary, the average water demands of 500 gpm can be met with existing water system delivery capacity and storage reserves. There will be no adverse impact on current capacity or service levels to others. Final design configuration will require abandonment and re-routing of some water mains. Furthermore, fire demand can be supported in terms of water storage capacity. However, the required fire flow rates and pressures may require booster pumping dependent on the final design.

Please contact us if you need any further information.

Very truly yours,

Mohawk Valley Water Authority
