WHEREAS, the immediate operation of the provisions of this Ordinance is necessary for the preservation of the public health, public safety, and general welfare, an EMERGENCY is hereby declared to exist, and this Ordinance shall be in full force and effect from and after its passage by the Indian County Board of Commissioners and publication and posting as required by law. Adopted by the Indian County Board of Commissioners this 12th day of October 2017.

APPENDIX B. SAMPLE ORDINANCE FOR LARGER THAN UTILITY
TYPE AIRPORT WITH INSTRUMENT APPROACHES

ZONING ORDINANCE TO LIMIT HEIGHT OF OBJECTS AROUND AIRVILLE AIRPORT

An ordinance regulating and restricting the height of structures and obstructions of natural growth, and otherwise regulating the use of property, in the vicinity of the Airville Airport by creating the appropriate zones and establishing the boundaries thereof, providing for changes by the Board of Adjustments and Board of Zoning Appeals, defining certain terms used herein; referring to the Airville Airport Plat Map which is incorporated therein and made a part of this Ordinance; providing for enforcement, establishing a Board of Adjustments; and providing for penalties.

This Ordinance is adopted pursuant to the authority conferred by Chapter 14 of Statutes of the State of Texas. The Board found that an obstruction near the airport will be endangering the life and property of users of Airville Airport, and property in the vicinity of said airport; that an obstruction of the Airport will impede and hinder instrument approach minima of Airville Airport and that an obstruction near the edge of such minima for the landing, takeoff, and maneuvering of aircraft, thus leading to costly or harmful accidents at Airville Airport and to a public health and safety hazard.

- (1) that the construction, establishment of an obstruction and the potential of being a public nuisance and an injury to the region served by Airville Airport;
- (2) that it is necessary in the interest of the public health, public safety, and general welfare that the creation or establishment of obstructions not be a hazard to air navigation as presently used;
- (3) that the preservation of large obstructions which are situated on the actual legally possessed, by the owner of the property, land without compensation;

It is further declared that the creation of the creation, establishment or retention of obstructions, the definition, removal, alteration or relocation of obstructions, the construction, or seeking and creating of obstructions and other purposes or actions which are a public nuisance may pass any expense, public funds and require time or interference in land

IT IS THE POLICY OF THE CITY OF AIRVILLE, TEXAS, AS FOLLOWS:

ARTICLE 1. SHORT TITLE

It is declared that the following be cited as Airville Airport Zoning Ordinance

Article 1. Definitions

As used in this Ordinance, unless the context otherwise requires:

1. **APPROACH** - Means driveway or ramp.
2. **APPROACH ELEVATION** - 10 feet above mean sea level.
3. **APPROACH SURFACE** - A surface along a way, as defined by the extended outside corner line, extending beyond and upward from the end of the finished surface and at the same slope as the approach, with height limitation slope set forth in Section 14 of this Ordinance. In plan the perimeter of the approach surface is coextensive with the perimeter of the approach zone.
4. **AREAS**, **LAND**, **TRAIL**, **WAY**, **WATERWAY**, **WATERWAY ZONE** - These words are set forth in Section 14 of this Ordinance.
5. **BOAT** - MEANS THE SAME AS BOAT AS DEFINED IN CHAPTER 12 OF THE LAWS OF THE STATE OF WISCONSIN.
6. **CRACKED SURFACE** - A surface extending beyond and upward from the perimeter of the finished surface at a slope of 20 to 1 for a horizontal distance of 1,000 feet.
7. **HARZARD TO NAVIGATION** - Any condition, structure, or device which has a substantial adverse effect on the safe and efficient navigation of the navigable waters.
8. **HEIGHT** - For the purpose of determining the height limit in all cases set forth in this Ordinance, the water level shall be the mean high water level, unless otherwise indicated.
9. **REGULATED ZONE** - A regulated plain type wetlands, the unadjoined airport elevation, the perimeter of water or other wetland with the connection to the navigable zone.
10. **TRIPLES** - MEAN HEIGHT MEASUREMENT - A survey used to determine the area intended to be used by private or public aircraft of greater than 12,500 pounds maximum gross weight and its lowered altitude.
11. **UNDESIRABLE USE** - Any use which is not listed in Section 14 of this Ordinance or use which is not listed in subsection with the provisions of this Ordinance or is prohibited by law.

2. **APPROXIMATE DISTANCE BETWEEN STAKE** = a primary bearing or bearing distance used to approximate the distance between two points on the ground. It is calculated by multiplying the distance of each leg by the cosine of the angle between the two legs. It is used to approximate the distance between two points.
3. **APPROXIMATE** = any statement, proposal or other statement, including a statement of work, which is made in writing by the contractor for the purpose of the contract.
4. **BENCH** = an established point, or any other point, on which a surveying instrument is set up to determine the position of other points. It is usually a point of known elevation or other characteristics.
5. **PROVISIONAL DISTANCE BETWEEN STAKE** = a distance between two points on the ground, approximated by the use of a bearing and distance. It is used to approximate the distance between two points on the ground. It is calculated by multiplying the distance of each leg by the cosine of the angle between the two legs. It is used to approximate the distance between two points.
6. **PROVISIONAL DISTANCE BETWEEN STAKE** = a distance between two points on the ground, approximated by the use of a bearing and distance. It is used to approximate the distance between two points on the ground. It is calculated by multiplying the distance of each leg by the cosine of the angle between the two legs. It is used to approximate the distance between two points.
7. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
8. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
9. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
10. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
11. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
12. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
13. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
14. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
15. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
16. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
17. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
18. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
19. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.
20. **STAKE** = a vertical rod or pole, usually of wood or metal, used to mark a point on the ground. It is usually used to mark a point of known elevation or other characteristics.

23. **UTILITY TRENCH** - A narrow, shallow excavation for all purposes to be used by power, communication, utility or other systems, excluding storm drains and ditches.
24. **VISUAL OBSCURE** - A runway extension solely for the operation of aircraft using visual approach procedures.

SECTION III: AIRPORT DATA

In order to comply with the provisions of Title 26, Chapter 12, which have been created and established herein, the following shall include all of the land, zone boundary, non-surface easements, and related easements, easements, encroachments, and other surface encroachments as shown on the Airport Record. Such records are shown on sheets A-1000, B-1000, C-1000, D-1000, E-1000, F-1000, G-1000, H-1000, I-1000, J-1000, K-1000, L-1000, M-1000, N-1000, O-1000, P-1000, Q-1000, R-1000, S-1000, T-1000, U-1000, V-1000, W-1000, X-1000, Y-1000, Z-1000, AA-1000, AB-1000, AC-1000, AD-1000, AE-1000, AF-1000, AG-1000, AH-1000, AI-1000, AJ-1000, AK-1000, AL-1000, AM-1000, AN-1000, AO-1000, AP-1000, AQ-1000, ZH-1000, ZI-1000, ZJ-1000, ZK-1000, ZL-1000, ZM-1000, ZN-1000, ZO-1000, ZP-1000, ZQ-1000, ZR-1000, ZS-1000, ZT-1000, ZU-1000, ZV-1000, ZW-1000, ZX-1000, ZY-1000, ZZ-1000

1. **Utility Trench Approach Zone** - The inner edge of this approach zone extends from the edge of the primary surface and is 500 feet wide. The approach zone expands outward uniformly to a width of 2,000 feet at a horizontal distance 500 feet from the primary surface. Its centerline is the continuation of the centerline of the runway.
2. **Runway Edge Light Utility Trench Approach Zone** - The inner edge of this approach zone extends from the edge of the primary surface and is 500 feet wide. The approach zone expands outward uniformly to a width of 2,000 feet at a horizontal distance 500 feet from the primary surface. Its centerline is the continuation of the centerline of the runway.
3. **Runway Edge Light Utility With A Visibility Minimum Greater Than 1/4 Mile Obstruction Instrument Approach Zone** - The inner edge of this approach zone extends from the edge of the primary surface and is 500 feet wide. The approach zone expands outward uniformly to a width of 2,000 feet at a horizontal distance of 500 feet from the primary surface. Its centerline is the continuation of the centerline of the runway.

6. Utility Easement Easement Approach Zone - The inner edge of this easement zone distances with the side of the primary surface and is 1,000 feet wide. The approach zone expands outward uniformly to a width of 4,000 feet at a horizontal distance of 10,000 feet from the primary surface. Its centerline is the continuation of the centerline of the alley.
7. Accession Easement Easement Approach Zone - The inner edge of this approach zone distances with the side of the primary surface and is 1,000 feet wide. The approach zone expands outward uniformly to a width of 11,000 feet at a horizontal distance of 10,000 feet from the primary surface. Its centerline is the continuation of the center line of the alley.
8. Horizontal Easement - The horizontal zones are the areas between the horizontal surfaces.
9. Horizontal Zone - The horizontal zone is established by extending areas of 1,000 feet from the all easements designated on the plan and 11,000 feet for all others from the center of each end of the primary surface of each alley and connecting the adjacent ends of adjoining areas tangent to these areas. The horizontal zones are located between the approach and horizontal zones.
10. Utility Easement - The utility easement is hereby created and shall extend along the primary surface of the horizontal zone and shall be subject to easements and encumbrances appurtenant to the same.

SECTION IV. ALLEY EASEMENT HEIGHT REGULATIONS

Except as otherwise provided in this Ordinance, no structure shall be located, altered, or maintained and no tree shall be allowed to grow in any zone created by this Ordinance to a height in excess of the maximum height and areas established for such zone. Some sign height regulations shall also apply established for each of the zones in order to meet the law.

1. Utility Easement Easement Approach Zone - A height of 10 feet shall apply for each tree located along the primary surface of the horizontal zone established as the primary surface and extending to a horizontal distance of 3,000 feet along the extended alley centerline.
2. Utility Easement Easement Approach Zone - A height of 12 feet shall apply for each tree located along the primary surface of the horizontal zone established as the primary surface and extending to a horizontal distance of 1,000 feet along the extended alley centerline.
3. Alley Easement Easement Approach Zone - A height of 10 feet shall apply for each tree located along the primary surface of the horizontal zone established as the primary surface and extending to a horizontal distance of 3,000 feet along the extended alley centerline.

SECTION 16: AIRCRAFT LIGHTS

Keep clear of any other provisions of this Ordinance, he/she may be liable if he/she or another aircraft operator is held liable by the City Manager or any other person for any violation of this Ordinance. The City Manager shall have the authority to require the operator of an aircraft to install or maintain any lighting or other equipment on the aircraft if it is determined that such equipment is necessary for the safety of the aircraft or the public. The City Manager shall have the authority to require the operator of an aircraft to install or maintain any lighting or other equipment on the aircraft if it is determined that such equipment is necessary for the safety of the aircraft or the public. The City Manager shall have the authority to require the operator of an aircraft to install or maintain any lighting or other equipment on the aircraft if it is determined that such equipment is necessary for the safety of the aircraft or the public.

SECTION 17: AIRCRAFT LIGHTS

1. Beacon and Rotating Beacons - The regulations prescribed in this Ordinance shall be amended to require the beacon, lighting, or other change or alteration of any aircraft or base not conforming to the regulations of the Federal Aviation Administration, or otherwise, to be brought into compliance with the regulations prescribed herein. The City Manager shall have the authority to require the operator of an aircraft to install or maintain any lighting or other equipment on the aircraft if it is determined that such equipment is necessary for the safety of the aircraft or the public.
2. Beacon and Rotating Beacons - Notwithstanding the preceding provisions of this Ordinance, the owner of any existing beaconing structure or base or other equipment on a particular installation, structure, and maintenance program of such beacons and lights shall be deemed to be in compliance with the regulations of the Federal Aviation Administration if the City Manager is notified by the operator of aircraft in the vicinity of the airport, the presence of such aircraft obstructive beaconing and light, shall be installed, operated and maintained at the expense of the City of Greenville.

SECTION 18: SIGNS

1. Signs - Except as specifically provided in this Ordinance, no sign shall be erected or otherwise established, nor any sign shall be placed on any structure hereby treated unless a permit has been obtained from the City Manager. Each application for a permit shall indicate the purpose for which the permit is desired, and shall set forth the location of the sign to be erected and the resulting use, structure, or area which would be affected by the sign. If the sign to be erected conforms to the regulations herein prescribed, a permit shall be granted. In the alternative, the permit shall be granted, no permit for a sign inconsistent with the provisions of this Ordinance shall be granted, or any sign hereby treated shall be removed or demolished if a permit for a sign has been approved in accordance with Section 17.1.1.

- a. In the areas lying within the limits of the restricted zone, no additional trees or shrubs shall be required for such trees or shrubs as have been removed or have become dormant, unless such trees, except when removed or dormant, had a canopy or topographic features, such trees or shrubs may extend above the height limits prescribed for such zones;
- b. In areas lying within the limits of the approach zones but not horizontal distance of not less than 1.200 feet from each end of the runway, no permit shall be required for any trees or structures less than seventy five feet of vertical height above the ground, except when such trees or structures would extend above the height limits prescribed for such approach zones;
- c. In the areas lying within the limits of the remaining zones beyond the perimeter of the restricted zone, no permit shall be required for any trees or structures less than one hundred feet of vertical height above the ground, except when such trees or structures, absence of terminal and canopy, or topographic features, would extend above the height limit prescribed for such transition zones.

Nothing contained in any of the foregoing subsections shall be construed as mandating or intending to permit any construction, or alteration of any structure, or growth of any tree in excess of any of the height limits established by this Ordinance except as set forth in Section IV, 13.

2. Existing Trees - No permit shall be granted that would allow the existing height or projection or other feature or permit a structure to be constructed, to face or locate a greater hazard to air navigation, than it was on the effective date of this Ordinance or any amendments thereto or than it is when the application for a permit is made. Except as indicated, all applications for such a permit shall be granted.
3. Non-conforming Uses Allowed to be Deleted - Whenever the City Manager determines that a non-conforming use or structure has been abandoned or that 50 percent has been destroyed, a permit shall be granted for such use or structure to be used in accordance with the zoning regulations.
4. Plantings - Any person owning or operating a structure the height of any structure, or permit the growth of any tree, or any structure, shall be deemed to be in compliance with the regulations prescribed in this Ordinance, if any apply to the same, if he complies for a year with the regulations, when the application for such use or structure is approved or is abandoned, and if from the issuance of such permit, or the expiration of the period of compliance, the growth of any tree, or any structure, which is subject to the regulations prescribed in this Ordinance, shall be such as to be compatible with the regulations prescribed in this Ordinance, and if such person shall not at any time apply for such a permit or be in compliance with the regulations.

result in unnecessary expense and relief granted, will not be contrary to the public interest. Will not require a hearing to air navigation will be substantial justice, and will be in accordance with the spirit of this Ordinance. Additionally, no application for variance to the requirements of this Ordinance will be considered by the Board of Adjustment unless a copy of the application has been furnished to the Airport Manager for advice as to the operational effects of the variance. If the Airport Manager does not respond to the application within 15 days after receipt, the Board of Adjustment may act on its own to grant or deny said application.

5. **Signage, Sign Marking and Lighting** - Any permit or variance awarded may, if such action is deemed advisable to effectuate the purposes of this Ordinance and is reasonable in the circumstances, be so conditioned as to require the owner of the structure or item in question to install, operate, and maintain, at the owner's expense, such signage and lights as may be necessary. If deemed proper by the Board of Adjustment, this condition may be modified to require the owner to permit the City of Knoxville, at its own expense, to install, operate, and maintain the necessary markings and lights.

SECTION VIII - PROVISIONS

1. Any appeal to the Board of Adjustment in this Ordinance shall be filed with the negative and positive parties, as designated on permit and variances shall be due to the City Manager and a form published for that purpose. Applications may be filed with a fee amount to be submitted to the City Manager shall be promptly considered and granted or denied. Applications for action by the Board of Adjustment shall be forthwith transmitted by the City Manager.

SECTION IX: BOARD OF ADJUSTMENT

1. There is hereby created a Board of Adjustment to have and exercise the following powers: (i) to hear and decide appeals from any order, requirement, condition, or determination made by the City Manager in the enforcement of this Ordinance; (ii) to hear and decide appeals or exceptions to the terms of those and other laws which may be issued by Adjustment under such regulations may be required to pass; and (iii) to hear and decide specific variances.
2. The Board of Adjustment shall consist of three members appointed by the City Council and shall serve for a term of three years unless a successor is duly appointed and qualified. If one member dies or resigns, one shall be appointed for a term of one year, and for a term of two years, and one for a term of three years. Vacancies shall be filled by the appointing authority for leave, upon so long as they are after a public hearing.

4. The Board of Adjustment shall report action for the government strip of property with the jurisdiction of this ordinance. Verbatim of the record of adjournment shall be kept at the hall of the City Manager and no such other place as the Board of Adjustment may determine. The City Manager or, in his absence, the Commissioner, the Acting Chairman or any other member shall announce the substance of adjournment. All meetings of the Board of Adjustment shall be public. The Board of Adjustment shall keep a record of its proceedings naming the vote of each member, each present, any or all absent or failing to vote, indicating such fact, and shall keep records of its expenditures and other official actions, all of which shall immediately be filed in the office of the City Clerk and on the case page.
5. The Board of Adjustment may, under an order of the City Manager, give the use of law giving the same effect as if the same had been given by the City Manager, from such time as the Board of Adjustment, or any other person, may determine, shall so determine, or shall make orders in order the execution of such ordinance.
6. The continuing vote of a majority of the members of the Board of Adjustment shall be sufficient to exercise any order, adjournment, decision, or continuation of the City Manager, or decide in favor of the applicant for any action covered and is not required to pass under this ordinance, or to affect violation of this ordinance.

SECTION 11: APPEALS

1. The person aggrieved, or any lawyer affected, by any decision of the City Manager, made in the administration of the Ordinance, may appeal to the Board of Adjustment.
2. All appeals hereunder must be taken within a reasonable time as provided by the rules of the Board of Adjustment, by filing with the City Manager a notice of appeal specifying the grounds hereof. The City Manager shall transmit promptly to the Board of Adjustment all the papers constituting the record upon which the action appealed from was based.
3. An appeal shall stay all proceedings in enforcement of the action appealed from unless the City Manager certifies to the Board of Adjustment, after the notice of appeal has been filed with it, that by reason of the fact stated in the certificate a stay would in the opinion of the City Manager cause imminent peril to life or property. In such cases, proceedings shall not be stayed except by order of the Board of Adjustment as notified to the City Manager and on due cause shown.

10/14/57

CG 1596100-1A
APPENDIX 1

4. The Board of Adjustment shall file a proposed written order hearing appeal, upon public notice and a notice within the periods in interest, and decide the same within a reasonable time. Upon the hearing, any party may appear in person or by agent or by attorney.
5. The Board of Adjustment may, in conformity with the provisions of this Ordinance, reverse or affirm, in whole or in part, or modify the order, regulations, decisions, or determination appealed from, and may make such order, regulations, decisions, or determination as may be appropriate under the circumstances.

SECTION XII: APPEALS

Any person aggrieved, or any taxpayer affected, by any decision of the Board of Adjustment may appeal to the Circuit Court of the State of Illinois in Section III of Article IV of the Constitution of the State of Illinois.

SECTION XIII: PENALTIES

Each violation of this Ordinance or of any regulation, order, or ruling promulgated hereunder shall constitute a misdemeanor and be punishable by a fine of not more than 500 dollars or imprisonment for not more than 180 days or both; and each day a violation continues in default shall constitute a separate offense.

SECTION XIV: CONFLICTING REGULATIONS

Where there exists a conflict between any of the regulations or limitations prescribed in this Ordinance and any other regulations applicable to the same area, whether the conflict be with respect to the height of structures or trees, and the use of land, or any other matter, the more stringent limitation or requirement shall govern and prevail.

SECTION XV: SEVERABILITY

If any of the provisions of this Ordinance or the application thereof to any person or circumstances are held invalid, such invalidity shall not affect those provisions or applications of the Ordinance which can be given effect without the invalid provisions or applications, and to this end, the provisions of this Ordinance are declared to be severable.

SECTION XVI: EFFECTIVE DATE

WHEREAS, the immediate operation of the provisions of this Ordinance is necessary for the preservation of the public health, safety, and general welfare, an EMERGENCY is hereby declared to exist, and this Ordinance shall be in full force and effect from and after the passage by the City Council and publication and posting as required by law. Adopted by the City Council on this 20th day of October, 1975.

Advisory Circular

Subject: Heliport Design

Date: 4/24/2012

AC No: 150/5390-2C

Initiated by: AAS-100

Change:

- 1. Purpose.** This advisory circular (AC) provides standards for the design of heliports serving helicopters with single rotors. Apply basic concepts to facilities serving helicopters with tandem (front and rear) or dual (side by side) rotors, however many standards will not apply.
- 2. Cancellation.** This AC cancels AC 150/5390-2B, Heliport Design, dated September 30, 2004.
- 3. Application.** The Federal Aviation Administration (FAA) recommends the guidelines and specifications in this AC for materials and methods used in the construction of heliports. In general, use of this AC is not mandatory. However, use of this AC is mandatory for all projects funded with federal grant monies through the Airport Improvement Program (AIP) and with revenue from the Passenger Facility Charge (PFC). See Grant Assurance No. 34, Policies, Standards, and Specifications, and PFC Assurance No. 9, Standards and Specifications. For information about grant assurances, see http://www.faa.gov/airports/aip/grant_assurances/. The use of terms implying strict compliance applies only to those projects. Other federal agencies, states, or other authorities having jurisdiction over the construction of other heliports decide the extent to which these standards apply.
- 4. Principal changes.**
 - a. Changed the term for the helicopter overall length (OL) to ‘D’ or ‘D-value.’
 - b. Added definitions for design loads for static and dynamic load-bearing areas (LBA).
 - c. Added guidance for pavement or structure larger than the touchdown and liftoff area (TLOF), but less than the size of the final approach and take off (FATO).
 - d. Added guidance for turbulence effects.
 - e. Added guidance to provide adequate clearance between parking areas and taxi routes and within parking areas.
 - f. Added guidance for minimum dimensions of curved approach/departure airspace.
 - g. Added guidance for Touchdown/Positioning Circle (TDPC) Marking.
 - h. Added guidance for Flight Path Alignment Guidance markings and lights.
 - i. Added an appendix providing guidance for Emergency Helicopter Landing Facility Requirements (EHLF).
 - j. Added FATO to FATO separation distance for simultaneous operations.
 - k. Revised standards for size of “H” for general aviation heliports.
 - l. Added increased TLOF size when the FATO of a hospital heliport is not load bearing.

- n.** Combined chapter 6, Non-Precision Instrument Operations and Chapter 7, Precision Approach Operations into chapter 6, Instrument Operations. Reference FAA Order 8620 series.
- o.** To improve the legibility of the AC, changed the format to a single column and nested the tables in the text.
- p.** Deleted requirements for load bearing capacity of a FATO at general aviation and hospital heliports when the TLOF is marked.
- q.** Changed color of landing direction lights from yellow to green.
- r.** Added references to Engineering Brief 87, Heliport Lights for Visual Meteorological Conditions (VMC).
- 5. Use of metrics.** This AC includes both English and metric dimensions. The metric conversions may not be exact equivalents, and the English dimensions govern.
- 6. Copies of this AC.** This and other advisory circulars published by the Office of Airport Safety and Standards are available on the FAA Office of Airports web page at www.faa.gov/airports.

MICHAEL J. O'DONNELL

Director of Airport Safety and Standards

Chapter 1. Introduction

101. Background. Section 103 of the Federal Aviation Act of 1958 states in part, “In the exercise and performance of his power and duties under this Act, the Secretary of Transportation shall consider the following, among other things, as being in the public interest: (a) The regulation of air commerce in such manner as to best promote its development and safety and fulfill the requirements of defense; (b) The promotion, encouragement, and development of civil aeronautics . . .” This public charge, in effect, requires the development and maintenance of a national system of safe heliports. Using the standards and recommendations contained in this publication in the design of heliports supports this public charge. These standards and recommendations, however, do not limit or regulate the operations of aircraft. When it is not feasible to meet all the standards and recommendations in this AC, consult with the appropriate offices of the Federal Aviation Administration (FAA) Office of Airports and Flight Standards Service to identify any adjustments to operational procedures necessary to accommodate operations to the maximum extent.

102. General. This chapter provides an explanation of terms used in this AC, describes the notification responsibilities of heliport proponents to FAA, provides general siting guidance, and identifies sources of technical information relating to heliport planning and design of a civil heliport.

103. Facilities. While heliports can be large and elaborate, most are not. The basic elements of a heliport are clear approach/departure paths, a clear area for ground maneuvers, final approach and takeoff area (FATO), touchdown and liftoff area (TLOF), safety area, and a wind cone. This minimal facility may be adequate as a private use prior permission required (PPR) heliport, and may even suffice as the initial phase in the development of a public use heliport capable of serving the general aviation segment of the helicopter community.

104. Planning. While the heliport itself may be simple, the planning and organization required to properly put one into place can be intimidating. Consider the physical, technical, and public interest matters described in this document in the planning and establishment of a heliport. While this AC is a technical document intended to help engineers, architects, and city planners design, locate, and build the most effective heliport, anyone considering the construction of a heliport can use it. Figures in this document are general representations and are not to scale.

105. Existing heliports. When a change to an existing heliport requires the submission of FAA Form 7460-1, Notice of Proposed Construction or Alteration, or FAA Form 7480-1, Notice of Landing Area Proposal, bring the heliport up to current standards. It may not, however, be feasible to meet all current standards at existing heliports. In those cases, consult with the appropriate offices of the FAA Office of Airports and Flight Standards Service to identify any adjustments to operational procedures necessary to accommodate operations to the maximum extent.

106. Location. The optimum location for a heliport is near the desired origination and/or destination of the potential users. Industrial, commercial, and business operations in urban locations are demand generators for helicopter services, even though they often compete for the limited ground space available. Heliport sites may be adjacent to a river or a lake, a railroad, a freeway, or a highway, all of which offer the potential for multi-functional land usage. These locations also have the advantage of relatively unobstructed airspace, which can be further protected from unwanted encroachment by properly enacted zoning. As vertical flight transportation becomes more prevalent, requirements for scheduled “airline type” passenger services may necessitate the development of an instrument procedure to permit “all-weather” service.

107. AC organization. This AC is structured to provide communities and persons intending to develop a heliport, or become involved in regulating helicopter facilities, with general guidance on heliport requirements. The AC covers general aviation heliports (including PPR), transport heliports, hospital heliports, and emergency landing facilities. It is important for a heliport proponent to be familiar with the terminology used in this specialized field. This chapter defines terms used in the industry and identifies actions common to developing a heliport.

a. General aviation heliports. The term “general aviation” is technically defined as “flights conducted by operators other than Title 14 of the Code of Federal Regulations (CFR) Part 121 or Part 135 certificate holders.”¹ However, for the purposes of this AC, “general aviation” refers to all helicopter operations other than scheduled passenger service. Hospital heliports and emergency landing facilities fall under general aviation, but are treated separately in the AC due to their unique requirements. General aviation heliports are normally privately owned although they can be publicly owned. Find design standards for general aviation heliports in Chapter 2.

b. Transport heliports. Transport heliports will provide the community with a full range of vertical flight services including scheduled service by air carriers (airlines) using helicopters. These operations will require a more extensive airside and landside infrastructure with the potential capability to operate in instrument meteorological conditions. Find design standards for transport heliports in Chapter 3.

c. Hospital heliports. Hospital heliports are general aviation heliports that provide a unique public service. They are normally located close to the hospital emergency room or a medical facility. Find design standards for hospital heliports in Chapter 4.

d. Helicopter facilities on airports. When there are a significant number of helicopter operations on an airport, consider developing separate facilities specifically for helicopter use. Chapter 5 addresses helicopter facilities on airports.

e. Instrument operations. With the introduction of the global positioning system (GPS), it is now practical for heliports to have instrument approach procedures. Good planning suggests that heliport proponents plan for the eventual development of instrument approaches to their heliports. Consider the recommendations in Chapter 6 in contemplating future instrument operations at a heliport. It is wise to consider these issues during site selection and design.

f. Heliport gradients and pavement design. Chapter 7 addresses heliport gradients and pavement design issues.

g. The appendices provide information about emergency helicopter landing facilities, helicopter dimensional data, form and proportions of certain heliport markings, and a list of publications and resources referenced in this AC.

108. Explanation of terms. The Pilot/Controller Glossary of the Aeronautical Information Manual (AIM) defines terms used in the Air Traffic System. Copies of the AIM are available from the FAA web site <http://www.faa.gov/atpubs>. Other terms used in this publication follow:

a. Air taxi. Used both to refer to on-demand air carriers and as a synonym for “hover taxi.” See hover taxi.

b. Approach/departure path. The flight track helicopters follow when landing at or departing from a heliport. The approach/departure paths may be straight or curved.

¹Plane Sense General Aviation Information, U.S. Department of Transportation FAA-H-8083-19A, <http://www.faa.gov/library/manuals/aviation/media/faq-h-8083-19A.pdf>

c. Design helicopter. A single or composite helicopter that reflects the maximum weight, maximum contact load/minimum contact area, overall length (D), rotor diameter (RD), tail rotor arc radius, undercarriage dimensions, and pilot's eye height of all helicopters expected to operate at the heliport.

d. D (Formerly "OL"). The overall length of the helicopter, which is the dimension from the tip of the main or forward rotor to the tip of the tail rotor, fin, or other rear-most point of the helicopter. This value is with the rotors at their maximum extension. See Figure B-1. If only the value of the rotor diameter (RD) is known, estimate the value for D using the relationship $D = 1.2 RD$ (or conversely, $RD = 0.83 D$).

e. Design loads. Design and construct the TLOF and any load-bearing surfaces to support the loads imposed by the design helicopter and any ground support vehicles and equipment.

(1) Static load. For design purposes, the design static load is equal to the helicopter's maximum takeoff weight applied through the total contact area of the wheels or skids. See paragraph 707.

(2) Dynamic load. For design purposes, assume the dynamic load at 150 percent of the maximum takeoff weight of the design helicopter applied through the main undercarriage on a wheel-equipped helicopter or aft contact areas of skid-equipped helicopter. See paragraph 707.

f. Elevated heliport. A heliport located on a rooftop or other elevated structure where the TLOF is at least 30 inches (76 cm) above the surrounding surface (a ground level heliport with the TLOF on a mound is not an elevated heliport).

g. Emergency helicopter landing facility (EHLF). A clear area at ground level or on the roof of a building capable of accommodating helicopters engaged in fire fighting and/or emergency evacuation operations. An EHLF meets the definition of a heliport in this AC and under Title 14 CFR Part 157, Notice of Construction, Alteration, Activation, and Deactivation of Airports.

h. Final approach and takeoff area (FATO). A defined area over which the pilot completes the final phase of the approach to a hover or a landing and from which the pilot initiates takeoff. The FATO elevation is the lowest elevation of the edge of the TLOF. See Figure 7-3.

i. Final approach reference area (FARA). An obstacle-free area with its center aligned on the final approach course. It is located at the end of a precision instrument FATO.

j. Flush lights. Where the term "flush lights" is specified in this AC, interpret it as including semi-flush lights.

k. Frangible/frangibly mounted. While there is no accepted standard for frangibility in regard to helicopter operations, remove all objects from a FATO or safety area except those of the lowest mass practicable and frangibly mounted to the extent practicable.

l. General aviation heliport. A heliport intended to accommodate individuals, corporations, helicopter air taxi operators, and public safety agencies. For the purposes of this AC, "general aviation" refers to all helicopter operations other than scheduled passenger service. Hospital heliports and emergency landing facilities fall under general aviation, but are treated separately in the AC due to their unique requirements.

m. Ground taxi. The surface movement of a wheeled helicopter under its own power with wheels touching the ground.

n. Hazard to air navigation. Any object having a substantial adverse effect upon the safe and efficient use of the navigable airspace by aircraft, upon the operation of air navigation facilities, or upon existing or planned airport/heliport capacity as determined by the FAA.

- o. Heliport.** The area of land, water, or a structure used or intended to be used for the landing and takeoff of helicopters, together with appurtenant buildings and facilities.
- p. Heliport elevation.** The highest point of the TLOF expressed as the distance above mean sea level.
- q. Heliport imaginary surfaces.** The imaginary planes defined in Title 14 CFR Part 77, Safe, Efficient Use, and Preservation of the Navigable Airspace, centered about the FATO and the approach/departure paths, which are used to identify the objects where notice to and evaluation by the FAA is required. Recommendations may include realignment of approach/departure paths or removal, lowering, marking and lighting of objects.
- r. Heliport layout plan.** The plan of a heliport showing the layout of existing and proposed heliport facilities including the approach/departure paths.
- s. Heliport protection zone (HPZ).** An area off the end of the FATO and under the approach/departure path intended to enhance the protection of people and property on the ground.
- t. Heliport reference point (HRP).** The geographic position of the heliport expressed as the latitude and longitude at:
- (1) The center of the FATO, or the centroid of multiple FATOs, for heliports having visual and non-precision instrument approach procedures; or
 - (2) The center of the FARA when the heliport has a precision instrument procedure.
- u. Helistop.** A term sometimes used to describe a minimally developed heliport for boarding and discharging passengers or cargo. This AC does not use this term, as the design standards and recommendations this AC apply to all heliports.
- v. Hospital heliport.** A heliport limited to serving helicopters engaged in air ambulance, or other hospital related functions. A designated helicopter landing area located at a hospital or medical facility is a heliport and not a medical emergency site.
- w. Hover taxi (also called air taxi).** The movement of a wheeled or skid-equipped helicopter above the surface. Generally, this takes place at a wheel/skid height of 1 to 5 feet (0.3 to 1.5 m) and at a ground speed of less than 20 knots (37 km/h). For facility design purposes, assume a skid-equipped helicopter to hover-taxi.
- x. Landing position.** An area, normally located in the center of an elongated TLOF, on which the helicopter lands.
- y. Large helicopter.** A helicopter with a maximum takeoff weight of more than 12,500 lbs.
- z. Load-bearing area (LBA).** The portion of the FATO capable of supporting the dynamic load of the design helicopter.
- aa. Medical emergency site.** An unprepared site at or near the scene of an accident or similar medical emergency on which a helicopter may land to pick up a patient in order to provide emergency medical transport. A medical emergency site is not a heliport as defined in this AC.
- bb. Medium helicopter.** A helicopter with a maximum takeoff weight of 7,001 to 12,500 lbs.
- cc. Obstruction to air navigation.** Any fixed or mobile object, including a parked helicopter, of greater height than any of the heights or surfaces presented in subpart C of part 77 (see also paragraph 111 in this AC).
- dd. Overall length (D).** See D, paragraph 108.d.
- ee. Parking pad.** The paved center portion of a parking position.

ff. Prior permission required (PPR) heliport. A heliport developed for exclusive use of the owner and persons authorized by the owner and about which the owner and operator ensure all authorized pilots are thoroughly knowledgeable. These features include but are not limited to: approach/departure path characteristics, preferred heading, facility limitations, lighting, obstacles in the area, and size and weight capacity of the facility.

gg. Public use heliport. A heliport available for use by the general public without a requirement for prior approval of the owner or operator.

hh. RD. Rotor Diameter. The length of the main rotor, from tip to tip.

ii. Rotor downwash. The downward movement of air caused by the action of the rotating main rotor blades. When this air strikes the ground or some other surface, it causes a turbulent outflow of air from beneath the helicopter.

jj. Safety area. A defined area on a heliport surrounding the FATO intended to reduce the risk of damage to helicopters accidentally diverging from the FATO.

kk. Shielded obstruction. A proposed or existing obstruction that does not need to be marked or lighted due to its close proximity to another obstruction whose highest point is at the same or higher elevation.

ll. Shoulder line. A marking line perpendicular to a helicopter parking position centerline that is intended to provide the pilot with a visual cue to assist in parking.

mm. Small helicopter. A helicopter with a maximum takeoff weight of 7,000 lbs or less.

nn. Tail rotor arc radius. The distance from the hub of the main rotor to the outermost tip of the tail rotor or the rear-most point of the helicopter tail, whichever is farther.

oo. Takeoff position. An area, normally located on the centerline and at the ends of an elongated TLOF, from which the helicopter takes off. Typically, there are two such positions on an elongated TLOF, one at each end.

pp. Taxi route. An obstruction-free corridor established for the movement of helicopters from one part of a heliport/airport to another. A taxi route includes the taxiway plus the appropriate clearances on both sides.

qq. Taxiway. A marked route between the TLOF and other areas on the heliport. This AC defines two types of helicopter taxiways:

(1) **Ground taxiway.** A taxiway intended to permit the surface movement of a wheeled helicopter under its own power with wheels on the ground. The minimum dimensions defined for a ground taxiway may not be adequate for hover taxi.

(2) **Hover taxiway.** A taxiway intended to permit the hover taxiing of a helicopter.

rr. Touchdown and liftoff area (TLOF). A load-bearing, generally paved area, normally centered in the FATO, on which the helicopter lands and/or takes off.

ss. Transport heliport. A heliport intended to accommodate air carrier operators providing scheduled service.

tt. Touchdown/positioning circle (TDPC) marking. A circular marking located in the center of a TLOF or a parking position. When the pilot's seat is over the TDPC, the whole of the helicopter undercarriage will be within the TLOF or parking position and all parts of the helicopter rotor system will be clear of any obstacle by a safe margin.

uu. Unshielded obstruction. A proposed or existing obstruction that may need to be marked or lighted since it is not near another marked and lighted obstruction whose highest point is at the same or higher elevation.

109. Selection of approach/departure paths. Design heliports to the extent practicable for two approach/departure paths. Consider items such as the following in selecting the approach/departure paths:

a. Wind. Well-designed approach/departure paths permit pilots to avoid downwind conditions and minimize crosswind operations. Align the preferred flight approach/departure path, to the extent feasible, with the predominant wind direction. Base other approach/departure paths on the assessment of the prevailing winds or, when this information is not available, separate such flight paths and the preferred flight path by at least 135 degrees. If it is not feasible to provide complete coverage of wind through multiple approach/departure paths, operational limitations may be necessary under certain wind conditions. See paragraph 101.

b. Obstructions. In determining approach/departure paths, take into account the obstructions in the vicinity of the heliport and, in particular, those likely to be a hazard to air navigation. See paragraph 111.

c. Environmental impacts. In environmentally sensitive areas, select the final approach/departure path(s) to minimize any environmental impact, providing it does not decrease flight safety. See paragraph 113.

110. Notification requirements. Part 157 sets requirements for persons proposing to construct, activate, deactivate, or alter a heliport to give advance notice of their intent to the FAA. This includes changing the size or number of FATOs; adding, deleting, or changing an approach or departure route; or changing heliport status. An example of a heliport status change would be a change from private to public use or vice versa. When notification is required, file Form 7480-1 (see Figure 1-1) with the appropriate FAA Airports Regional or District Office at least 90 days before construction, alteration, deactivation, or change in use. See the FAA Airports web site at <http://www.faa.gov/airports/> for contact information.

a. Draw the heliport layout plan to scale showing key dimensions, such as the heliport elevation, TLOF size, FATO size, safety area size, distance from safety area perimeter to property edges, and approach/departure paths showing locations of buildings, trees, fences, power lines, obstructions (including elevations), schools, churches, hospitals, residential communities, waste disposal sites, and other significant features as specified on Form 7480-1 and as suggested in Figure 1-2.

b. The preferred type of location map is the 7.5-minute U.S. Geological Survey Quadrangle Map, available from the US Geological Survey at nationalmap.gov. Web-based maps are also acceptable. Show the location of the heliport site and the approach/departure paths on the map. Point out the heliport site on this map with an arrow. Indicate the latitude and longitude of the proposed heliport in North American Datum of 1983 (NAD-83) coordinates. See Figure 1-3.

c. The FAA role. The FAA will conduct an aeronautical study of the proposed heliport under part 157. Title 14 CFR Part 157.7, FAA determinations, states: "The FAA will conduct an aeronautical study of an airport proposal and, after consultations with interested persons, as appropriate, issue a determination to the proponent and advise those concerned of the FAA determination. The FAA will consider matters such as the effects the proposed action would have on existing or contemplated traffic patterns of neighboring airports; the effects the proposed action would have on the existing airspace structure and projected programs of the FAA; and the effects that existing or proposed manmade objects (on file with the FAA) and natural objects within the affected area would have on the airport proposal. While determinations consider the effects of the proposed action on the safe and efficient use of airspace by aircraft and the safety of persons and property on the ground, the determinations are only advisory. Except for an objectionable determination, each determination will contain a determination-void date to

facilitate efficient planning of the use of the navigable airspace. A determination does not relieve the proponent of responsibility for compliance with any local law, ordinance or regulation, or state or other federal regulation. Aeronautical studies and determinations will not consider environmental or land use compatibility impacts.”

Form 7480-1 (03/01) (03/01)

Figure 1–1. Form 7480-1, Notice of Landing Area Proposal

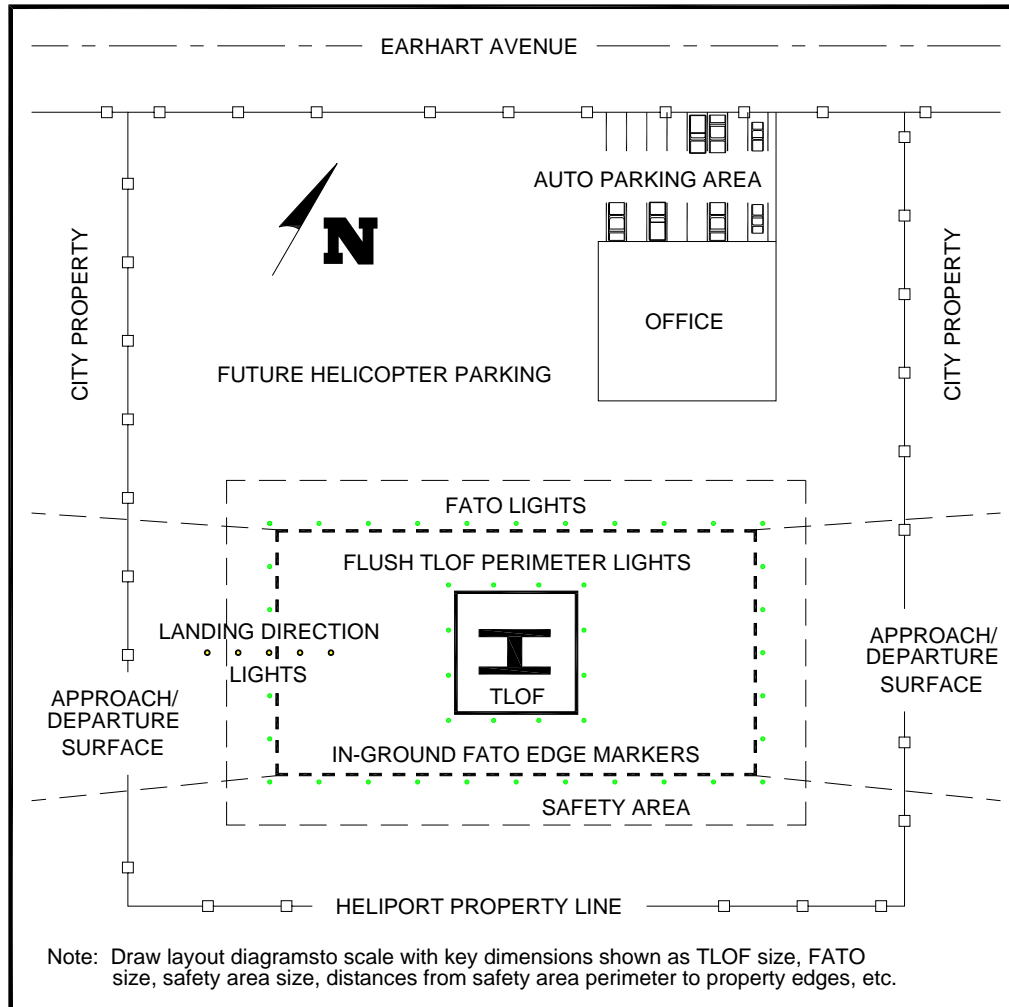

Figure 1-2. Example of a Heliport Layout Plan

d. Penalty for failure to provide notice. Persons who fail to give notice are subject to civil penalty under Title 49 United States Code 46301, Civil Penalties, of not more than \$25,000 (or \$1,100 if the person is an individual or small business concern).

e. Notice exemptions. Paragraph 157.1, Applicability, of part 157 exempts sites meeting one of the conditions below from the requirement to submit notice. These exemptions do not negate a notice or formal approval requirement prescribed by state law or local ordinance. For the purposes of applying the part 157 exemption criteria cited in (2) and (3) below, a landing and associated takeoff is considered to be one operation. Part 157.1 projects are:

(1) [A heliport] subject to conditions of a federal agreement that requires an approved current heliport layout plan to be on file with the FAA, or

(2) [A heliport] at which flight operations will be conducted under visual flight rules (VFR) and which is used or intended to be used for a period of less than 30 consecutive days with no more than 10 operations per day.

(3) The intermittent use of a site that is not an established airport, that is used or intended to be used for less than 1 year, and at which flight operations will be conducted only under VFR. For the purpose of this part, “intermittent use of a site” means:

(a) the site is used or is intended to be used for no more than 3 days in any one week and

(b) no more than 10 operations will be conducted in any one day at that site.

111. Hazards to air navigation. Part 77 establishes requirements for notification to the FAA of objects that may affect navigable airspace. It sets standards for determining obstructions to navigable airspace and provides for aeronautical studies of such obstructions to determine their effect on the safe and efficient use of airspace. Part 77 applies only to public airports and heliports, airports operated by a federal agency or the Department of Defense, and private airports and heliports with at least one FAA-approved instrument approach procedure. See Figure 1–4.

a. FAA studies.

(1) **Part 77.** Part 77 defines objects that are obstructions to surfaces. Presume these objects to be hazards unless an FAA study determines otherwise. The FAA conducts aeronautical studies to determine the physical and electromagnetic effect on the use of navigable airspace, air navigational facilities, public airports and heliports, and private airports and heliports with at least one FAA-approved instrument approach procedure. The FAA encourages public agencies to enact zoning ordinances to prevent man-made features from becoming hazards to navigation.

(2) **Part 157.** While the FAA performs aeronautical studies under part 157 (see paragraph 110.c), such studies do not identify hazards to private facilities that do not have an FAA-approved instrument approach.

b. Mitigation of hazards. You may mitigate the adverse effect of an object presumed or determined to be a hazard by:

(1) Removing the object.

(2) Altering the object, for example, reducing its height.

(3) Marking and/or lighting the object, provided an FAA aeronautical study has determined that the object would not be a hazard to air navigation if it were marked and/or lighted. Find guidance on marking and lighting objects in AC 70/7460-1, Obstruction Marking and Lighting.

c. Notification requirements. Part 77 requires persons proposing certain construction or alteration to give 45-day notice to the FAA of their intent. Use FAA Form 7460-1, Notice of Proposed Construction or Alteration to provide notification. See <https://oeaaa.faa.gov> for more information and to download the form.

d. Heliport development plans. Future public heliport development plans and feasibility studies on file with the FAA may influence the determinations resulting from part 77 studies. Owners of public heliports and owners of private heliports with FAA-approved instrument approach procedures can ensure full consideration of future heliport development in part 77 studies only when they file plans with the FAA. Include in heliport plan data the coordinates and elevations of planned FATO(s), approach/departure paths including their azimuths, and types of approaches for any new FATO or modification of an existing FATO.

Figure 1-3. Example of a Heliport Location Map

112. Federal assistance. The FAA administers a grant program that provides financial assistance to eligible sponsors to develop a public use heliport. Information on federal aid program eligibility requirements is available from FAA Airports Regional and District Offices and on the FAA Airports web site, www.faa.gov/airports.

113. Environmental impact analyses. The National Environmental Policy Act of 1969 requires the FAA to consider potential environmental impacts prior to agency decision making, including, for example, the decision to fund or approve a project, plan, license, permit, certification, rulemaking, or operations specification, unless these actions are within an existing categorical exclusion and no

extraordinary circumstances exist. Actions that may require an environmental assessment are normally associated with federal grants or heliport layout plan approvals leading to the construction of a new heliport or significant expansion of an existing heliport.

a. Assessment items. An environmental assessment addresses noise, historic and cultural resources, wildlife, energy conservation, land usage, air quality, water quality, pollution prevention, light emissions and other visual effects, electromagnetic fields, other public health and safety issues, the “no action” alternative and a reasonable range of feasible alternatives, including mitigation not integrated into the alternative initially. It also describes the action taken to ensure public involvement in the planning process. An opportunity for a public hearing may be required for the federally funded development of, or significant improvement to, an existing heliport.

b. Guidance. FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects, and FAA Order 1050.1, Policies and Procedures for Considering Environmental Impacts, and other supplemental guidance from FAA Air Traffic and Flight Standards provide guidance on environmental impact analysis. Contact state and local governments, including metropolitan planning organizations and local transit agencies, directly as they may also require an environmental report. The procedures in AC 150/5020-1, Noise Control and Compatibility Planning for Airports, describe a means of assessing the noise impact. Contact the appropriate FAA Airports Regional or District Office for current information related to assessing noise impact of heliports. Proponents of non-federally assisted heliports work with local governmental authorities concerning environmental issues.

114. Access to heliports by individuals with disabilities. Congress has passed various laws concerning access to airports. Since heliports are a type of airport, these laws are similarly applicable. Find guidance in AC 150/5360-14, Access to Airports by Individuals with Disabilities.

115. State role. Many state departments of transportation, aeronautical commissions, or similar authorities require prior approval and, in some instances, a license for the establishment and operation of a heliport. Several states administer a financial assistance program similar to the federal program and are staffed to provide technical advice. Contact your respective state aeronautics commissions or departments for particulars on licensing and assistance programs. Contact information for state aviation agencies is available at http://www.faa.gov/airports/resources/state_aviation.

116. Local role. Some communities have enacted zoning laws, building codes, fire regulations, etc. that can affect heliport establishment and operation. Some have or are in the process of developing codes or ordinances regulating environmental issues such as noise and air pollution. A few localities have enacted specific rules governing the establishment of a heliport. Therefore, make early contact with officials or agencies representing the local zoning board, the fire, police, or sheriff's department, and the elected person(s) who represent the area where the heliport is to be located.

117. Related referenced material. Find a list of related and referenced publications in Appendix D.

Figure 1-4. Offsite Development Requiring Notice to the FAA

Chapter 2. General Aviation Heliports

201. General. A general aviation heliport accommodates helicopters used by individuals, corporations, and helicopter air taxi services. While general aviation heliports may be publicly owned, this is not required. Most general aviation heliports are privately owned.

202. Applicability. The standards in this chapter apply to projects funded under the Airport Improvement Program (AIP) or the Passenger Facility Charge (PFC) program. For other projects/heliports, these standards are the FAA's recommendations for designing all general aviation heliports. The design standards in this chapter assume that there will never be more than one helicopter within the final approach and takeoff area (FATO) and the associated safety area. If there is a need for more than one touchdown and liftoff area (TLOF) at a heliport, locate each TLOF within its own FATO and within its own safety area. Figure 2-1 illustrates the essential features of a general aviation heliport.

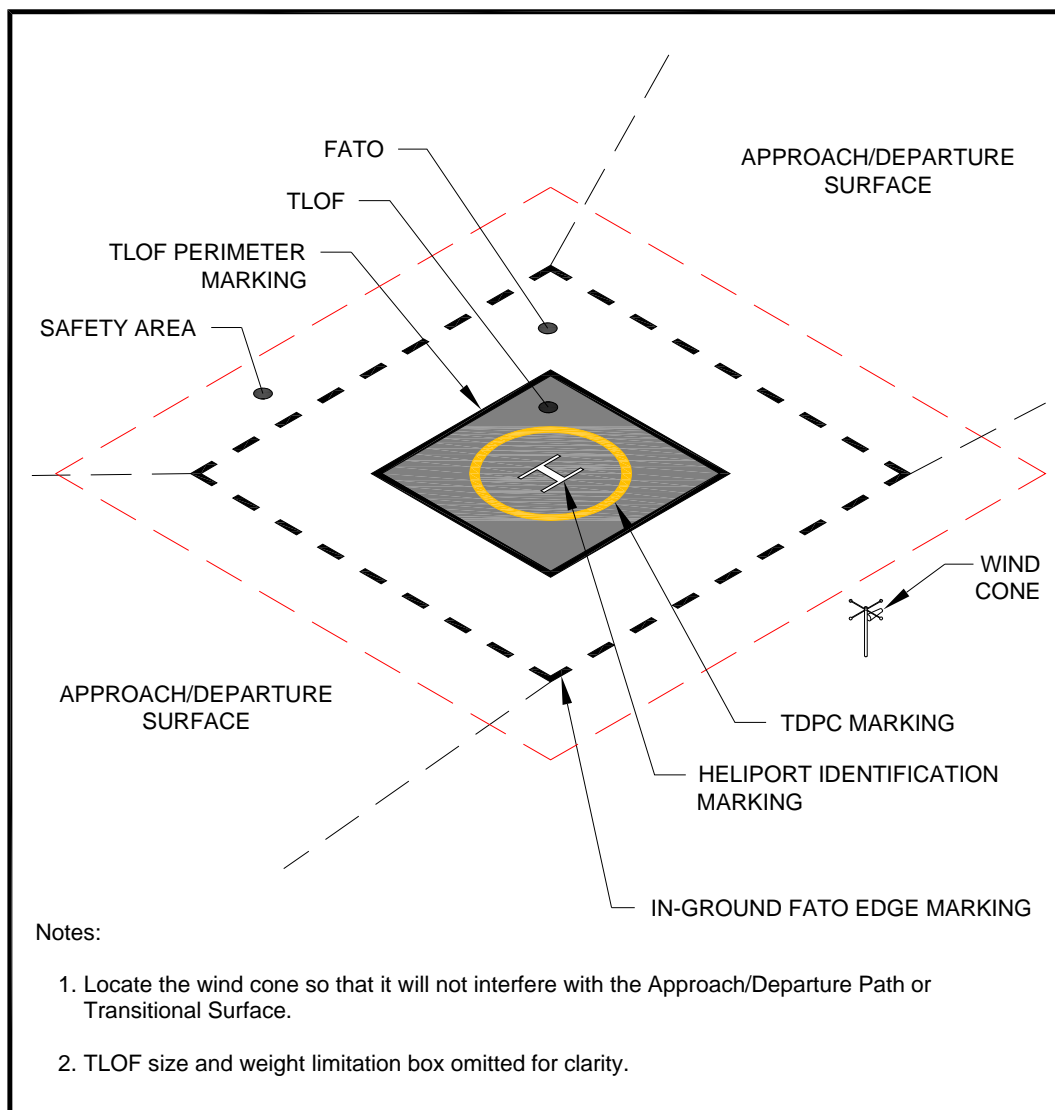

Figure 2-1. Essential Features of a Heliport: General Aviation

203. Prior permission required (PPR) facilities. The standards in this AC are recommended for all heliports. As PPR heliports are never eligible for federal financial assistance, do not interpret any recommendation in this AC that is not required by federal law or regulation as mandatory for PPR heliports. Recommendations for PPR heliports are provided in recognition of the unique nature of facilities where the operator ensures pilots are thoroughly familiar with the heliport, its procedures, and any facility limitations.

204. Access by individuals with disabilities. Various laws require heliports operated by public entities and those receiving federal financial assistance to meet accessibility requirements. See paragraph 114.

205. Heliport site selection.

a. Long term planning. The FAA encourages public agencies and others planning to develop a general aviation heliport to consider the possible future need for instrument operations and expansion.

b. Property requirements. The property needed for a general aviation heliport depends upon the volume and types of users, size of helicopters, and the scope of amenities provided. Property needs for helicopter operators and for passenger amenities frequently exceed those for “airside” purposes.

c. Turbulence. Air flowing around and over buildings, stands of trees, terrain irregularities, etc. can create turbulence on ground-level and roof-top heliports that may affect helicopter operations. Where the FATO is located near the edge and top of a building or structure, or within the influence of turbulent wakes from other buildings or structures, assess the turbulence and airflow characteristics in the vicinity of, and across the surface of the FATO to determine if an air-gap between the roof, roof parapet or supporting structure, and/or some other turbulence mitigating design measure is necessary. FAA Technical Report FAA/RD-84/25, Evaluating Wind Flow around Buildings on Heliport Placement, addresses the wind’s effect on helicopter operations. Take the following actions in selecting a site to minimize the effects of turbulence.

(1) Ground-level heliports. Features such buildings, trees, and other large objects can cause air turbulence and affect helicopter operations from sites immediately adjacent to them. Therefore, locate the landing and takeoff area away from such objects in order to minimize air turbulence in the vicinity of the FATO and the approach/departure paths.

(2) Elevated heliports. Establishing a 6 foot (1.8 m) or more air gap on all sides above the level of the roof will generally minimize the turbulent effect of air flowing over the roof edge. Keep air gaps free at all times of objects that would obstruct the airflow. If it is not practical to include an air gap or some other turbulence mitigating design measure where there is turbulence, operational limitations may be necessary under certain wind conditions. See paragraph 101.

d. Electromagnetic effects. Nearby electromagnetic devices, such as a large ventilator motor, elevator motor or other devices that consume large amounts of electricity may cause temporary aberrations in the helicopter magnetic compass and interfere with other onboard navigational equipment.

206. Basic layout. A basic heliport consists of a TLOF contained within a FATO. A safety area surrounds the FATO. Table 2-1 shows how the standards for safety area width vary as a function of heliport markings. The relationship of the TLOF to the FATO and the safety area is shown in Figure 2–2. A FATO contains only one TLOF. Provide appropriate approach/departure airspace to allow safe approaches to and departures from landing sites. To the extent feasible, align the preferred approach/departure path with the predominant winds. See paragraph 210.

**Table 2-1. Minimum VFR Safety Area Width
as a Function of General Aviation and PPR Heliport Markings**

General aviation heliports	$\frac{1}{3}$ RD but not less than 20 ft (6 m)**	$\frac{1}{3}$ RD but not less than 30 ft (9 m)**	$\frac{1}{2}$ D but not less than 20 ft (6 m)	$\frac{1}{2}$ D but not less than 30 ft (9 m)
PPR heliports	$\frac{1}{3}$ RD but not less than 10 ft (3 m) **	$\frac{1}{3}$ RD but not less than 20 ft (6 m)**	$\frac{1}{2}$ D but not less than 20 ft (6 m)	$\frac{1}{2}$ D but not less than 30 ft (9 m)
TLOF perimeter marked	Yes	Yes	No	No
FATO perimeter marked	Yes	Yes	Yes	Yes
Standard “H” marking	Yes	No	Yes	No
D: Overall length of the design helicopter RD: Rotor diameter of the design helicopter ** Also applies when the FATO is not marked. Do not mark the FATO if (a) the FATO (or part of the FATO) is a non-load bearing surface and/or (b) the TLOF is elevated above the level of a surrounding load-bearing area.				

207. Touchdown and liftoff area (TLOF).

a. TLOF location. TLOFs of general aviation heliports are at ground level, on elevated structures, and at rooftop level. Center the TLOF within the FATO. At a PPR rooftop or other PPR elevated facility, where the entire FATO is not load-bearing, locating the TLOF in a load-bearing area (LBA) that is as large as possible may provide some operational advantages. In this case, locate the TLOF in the center of the LBA.

b. TLOF size. Design the TLOF so the minimum dimension (length, width, or diameter) is at least equal to the RD of the design helicopter (except as noted in (2) below). Design the TLOF to be rectangular or circular. Each has its advantages. A square or rectangular shape provides the pilot with better alignment cues than a circular shape, but a circular TLOF may be more recognizable in an urban environment. Increasing the LBA centered on the TLOF may provide some safety and operational advantages. At PPR facilities, if only a portion of the TLOF is paved, design the TLOF so the minimum length and width of this paved portion is not less than two times the maximum dimension (length or width) of the undercarriage of the design helicopter. Locate the center of the TLOF in the center of this paved portion. To avoid the risk of catching a skid and the potential for a dynamic rollover, make sure there is no difference in elevation between the paved and unpaved portions of the TLOF.

(1) Elevated public general aviation heliport. If the FATO outside the TLOF is not load-bearing, increase the minimum width, length or diameter of the TLOF to the overall length (D) of the design helicopter. See paragraph 207.b(3).

(2) Elevated PPR heliports. At PPR rooftop or elevated facilities where the height of the TLOF surface above the adjacent ground or structure is no greater than 30 inches (76 cm), and there is a solid adjacent ground or structure equal to the rotor diameter (RD) able to support 20 lbs/sq ft (98 kg/sq m) live load, design the minimum dimension of the TLOF to be at least the smaller of the RD and two times the maximum dimension (length or width) of the undercarriage of the design helicopter. Locate the center of the LBA of the TLOF in the center of the FATO.

(3) Elongated TLOF. An elongated TLOF can provide an increased safety margin and greater operational flexibility. As an option, design an elongated TLOF with a landing position in the center and two takeoff positions, one at either end. Design the landing position to have a minimum length equal to the RD of the design helicopter. If the TLOF is elongated, also provide an elongated FATO. Figure 2–3 shows an elongated TLOF and an elongated FATO.

Figure 2-2. TLOF/FATO Safety Area Relationships and Minimum Dimensions: General Aviation

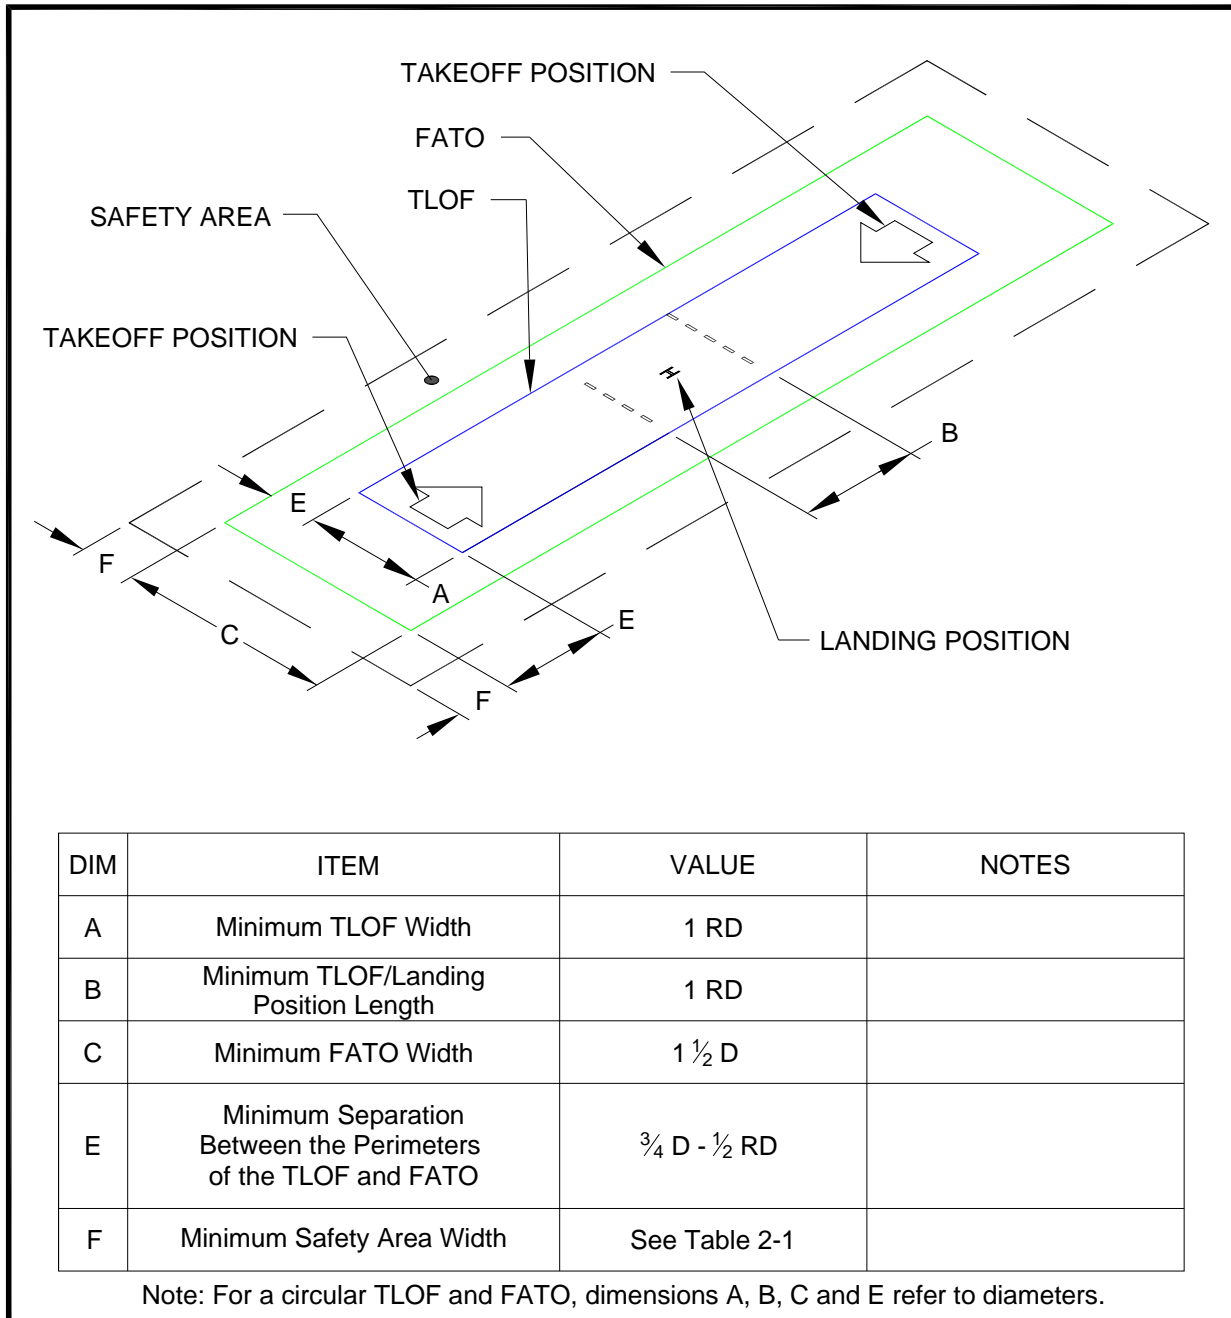

Figure 2-3. Elongated FATO with Two Takeoff Positions: General Aviation

c. Ground-level TLOF surface characteristics.

(1) Design loads. Design the TLOF and any supporting TLOF structure to be capable of supporting the dynamic loads of the design helicopter.

(2) Paving. Provide either a paved or aggregate-turf surface for the TLOF (see AC 150/5370-10, Standards for Specifying Construction of Airports items P-217, Aggregate-Turf Pavement and P-501, Portland Cement Concrete Pavement). Use portland cement concrete (PCC) when feasible for ground-level facilities. An asphalt surface is less desirable for heliports as it may rut under the wheels or skids of

a parked helicopter. This has been a factor in some rollover accidents. Use a broomed or roughened pavement finish to provide a skid-resistant surface for helicopters and non-slippery footing for people. For PPR heliports where only a portion of the TLOF is paved, design the paved portion to dynamic load-bearing. Design the adjacent ground or structure of the TLOF for the static loads of the design helicopter.

d. Rooftop and other elevated TLOFs.

(1) Design loads. Design elevated TLOFs and any TLOF supporting structure to capable of supporting the dynamic loads of the design helicopter described in paragraph 707.b. An elevated heliport is illustrated in Figure 2-4.

(2) Elevation. Elevate the TLOF above the level of any obstacle in the FATO and safety area that cannot be removed.

(3) Obstructions. Elevator penthouses, cooling towers, exhaust vents, fresh-air vents, and other raised features can affect heliport operations. Establish control mechanisms to ensure obstruction hazards are not installed after the heliport is operational.

(4) Air quality. Helicopter exhaust can affect building air quality if the heliport is too close to fresh air vents. When designing a building intended to support a helipad, locate fresh air vents accordingly. When adding a heliport to an existing building, relocate fresh air vents if necessary or, if that is not practical, installing charcoal filters or a fresh air intake bypass louver system for HVAC systems may be adequate.

(5) TLOF surface characteristics. Construct rooftop and other elevated heliport TLOFs of metal or concrete (or other materials subject to local building codes). Use a finish for TLOF surfaces that provides a skid-resistant surface for helicopters and non-slippery footing for people.

(6) Safety net. If the platform is elevated 4 feet (1.2 m) or more above its surroundings, Title 29 CFR Part 1910.23, Guarding Floor and Wall Openings and Holes, requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences since they would be safety hazards during helicopter operations. As an option, install a safety net meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load carrying capability of 25 lbs/sq ft (122 kg/sq m). Make sure the net, as illustrated in Figure 2-28, does not project above the level of the TLOF. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

Figure 2-4. Elevated Heliport: General Aviation

(7) Access to elevated TLOFs. Title 29 CFR Part 1926.34, Means of Egress, requires two separate access points for an elevated structure such as one supporting an elevated TLOF. Title 29 CFR Part 1910.24, Fixed Industrial Stairs applies to stairs. Design handrails required by this regulation to fold down or be removable to below the level of the TLOF so they will not be hazards during helicopter operations.

e. TLOF gradients. See paragraph 702 for TLOF gradient standards.

208. Final approach and takeoff area (FATO). A general aviation heliport has at least one FATO. The FATO contains a TLOF within its borders at which arriving helicopters terminate their approach and from which departing helicopters take off.

a. FATO size.

(1) Design the minimum width, length, or diameter of a FATO to be at least 1.5 times the overall length (D) of the design helicopter. Design the FATO to be circular or rectangular, regardless of the shape of the TLOF. At elevations above 1,000 feet MSL, include a longer, rectangular FATO to provide an increased safety margin and greater operational flexibility. Use the additional FATO length depicted in Figure 2–5. Where the operator of a PPR heliport chooses not to provide additional FATO length, the operator makes sure that all pilots using the facility are thoroughly knowledgeable with this and any other facility limitations.

(2) Design the minimum distance between the TLOF perimeter and the FATO perimeter to be not less than the distance ($\frac{3}{4}D - \frac{1}{2}RD$) where D is the overall length and RD is the rotor diameter of the design helicopter. Note that if the TLOF and FATO are not of similar shape, this applies at all points of the TLOF perimeter. The relationship of the TLOF to the FATO and the safety area is shown in Figure 2–2.

b. FATO surface characteristics. If the heliport operator marks the TLOF, the FATO outside the TLOF need not load-bearing.

(1) Ground level public general aviation heliports. If the heliport operator does not mark the TLOF (see paragraph 215.a), and/or intends that the helicopter be able to land anywhere within the FATO, design the FATO outside the TLOF and any FATO supporting structure, like the TLOF, to be capable of supporting the dynamic loads of the design helicopter, as described in paragraph 707.b.

(2) Ground level PPR heliports. If the heliport operator does not mark the TLOF, and/or intends for the helicopter to be able to land anywhere within the FATO, design the FATO outside the TLOF and any FATO supporting structure, like the TLOF, to be capable of supporting the dynamic loads of the design helicopter, as described in paragraph 707.b.

**Figure 2-5. Additional FATO Length for Heliports at Higher Elevations:
General Aviation**

(3) **Elevated heliports.** As an option, design the FATO outside the TLOF to extend into clear airspace. However, there are some helicopter performance benefits and increased operational flexibility if the FATO outside the TLOF is load bearing. Design the FATO outside of the TLOF to be load-bearing, or increase the minimum width and length or diameter of TLOF to the overall length of the design helicopter.

(4) **Elevated PPR heliports.** For elevated PPR heliports, if the heliport operator intends to mark the TLOF, as an option design the FATO outside the TLOF and the safety area to extend into the clear airspace (see Figure 2-4). If the heliport operator does not mark the TLOF, and/or intends that the helicopter be able to land anywhere within the FATO, design the FATO outside the TLOF and any FATO supporting structure, like the TLOF, to support the dynamic loads of the design helicopter. As an option, increase the length and width or diameter of the LBA without a corresponding increase in the size of the FATO.

(5) If the FATO is load-bearing, design the portion abutting the TLOF to be contiguous with the TLOF, with the adjoining edges at the same elevation.

(6) If the FATO is unpaved, treat the FATO to prevent loose stones and any other flying debris caused by rotor downwash.

(7) When the FATO or the LBA in which it is located is elevated 4 feet (1.2 m) or more above its surroundings, part 1910.23 requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences since they would be safety hazards during helicopter operations. As an option, install a safety net meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load carrying capability of 25 lbs/sq ft (122 kg/sq m). Make sure the net, as illustrated in Figure 2-28,

does not project above the level of the TLOF. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

c. Mobile objects within the FATO. The FATO design standards of this AC assume the TLOF and FATO are closed to other aircraft if a helicopter or other mobile object is within the FATO or the safety area.

d. Fixed objects within the FATO. Remove all fixed objects projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

e. FATO/FATO separation. If a heliport has more than one FATO, separate the perimeters of the two FATOs so the respective safety areas do not overlap. This separation assumes simultaneous approach/departure operations will not take place. If the heliport operator intends for the facility to support simultaneous operations, provide a minimum 200 foot (61 m) separation.

f. FATO gradients. See paragraph 703 for FATO gradient standards.

209. Safety area. A safety area surrounds a FATO.

a. Safety area width. The standards for the width of the safety area are shown in Table 2-1. The value is the same on all sides. The provision or absence of standard heliport markings affects the width standards. As an option, design the safety area to extend into clear airspace.

b. Mobile objects within the safety area. The safety area design standards of this AC assume the TLOF and FATO are closed to other aircraft if a helicopter or other mobile object is within the FATO or the safety area.

c. Fixed objects within a safety area. Remove all fixed objects within a safety area projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

d. Safety area surface. The safety area need not be load bearing. Figure 2–6 depicts a safety area extending over water. If possible, design the portion of the safety area abutting the FATO to be contiguous with the FATO with the adjoining edges at the same elevation. This is needed to avoid the risk of catching a helicopter skid or wheel. Clear the safety area of flammable materials and treat the area to prevent loose stones and any other flying debris caused by rotor wash.

e. Safety area gradients. Find safety area gradient standards in Chapter 7.

210. VFR approach/departure paths. The purpose of approach/departure airspace, shown in Figure 2–7 and Figure 2–8 is to provide sufficient airspace clear of hazards to allow safe approaches to and departures from the TLOF.

Figure 2-6. Non-load-bearing FATO and Safety Area: General Aviation

a. Number of approach/departure paths. Align preferred approach/departure paths with the predominant wind direction to avoid downwind operations and minimize crosswind operations. To accomplish this, design the heliport with more than one approach/departure path. Base other approach/departure paths on the assessment of the prevailing winds or, when this information is not available, separate such flight paths and the preferred flight path by at least 135 degrees. See Figure 2–7, Figure 2–8, and Figure 2–9. At a PPR heliport that has only one approach/departure path, the operator makes sure all pilots using the facility are thoroughly knowledgeable with this and any other facility limitations. A second flight path provides additional safety margin and operational flexibility. If it is not feasible to provide complete coverage of wind through multiple approach/departure paths, operational limitations may be necessary under certain wind conditions. See paragraph 101.

b. VFR approach/departure and transitional surfaces. Figure 2–7 illustrates the approach/departure and transitional surfaces.

(1) An approach/departure surface is centered on each approach/departure path. The approach/departure path starts at the edge of the FATO and slopes upward at 8:1 (8 units horizontal in 1 unit vertical) for a distance of 4,000 feet (1,219 m) where the width is 500 feet (152 m) at a height of 500 feet (152 m) above the heliport elevation.

(2) The transitional surfaces start from the edges of the FATO parallel to the flight path center line, and from the outer edges of the 8:1 approach/departure surface, and extend outwards at a slope of 2:1 (2 units horizontal in 1 unit vertical) for a distance of 250 feet (76 m) from the centerline. The transitional surface does not apply to the FATO edge opposite the approach/departure surface.

(3) Make sure the approach/departure and transitional surfaces are free of penetrations unless an FAA aeronautical study determines such penetrations not to be hazards. The FAA conducts such aeronautical studies only at public heliports, heliports operated by a federal agency or the Department of Defense, and private airports with FAA-approved approach procedures. Paragraph 111 provides additional information on hazards to air navigation.

(4) At PPR facilities, an alternative to considering transitional surfaces is to increase the size of the 8:1 approach/departure surface for a distance of 2,000 feet (610 m) as shown in Figure 2–9 and Figure 2–11. The lateral extensions on each side of the 8:1 approach/departure surface start at the width of the FATO and are increased so at a distance of 2,000 feet (610 m) from the FATO they are 100 feet (30 m) wide. Make sure obstacles do not penetrate into both Area A and Area B. Make sure obstacles do not penetrate into Area A or Area B unless the FAA determines that the penetration is not a hazard. Mark or light all such penetrations. See paragraph 111 for more information on hazard determinations.

c. Curved VFR approach/departure paths. As an option, include one curve in VFR approach/departure paths. As an option, design these paths to use the airspace above public lands, such as freeways or rivers. When including a curved portion in the approach/departure path, make sure the sum of the radius of the arc defining the center line and the length of the straight portion originating at the FATO is not less than 1,886 feet (575 m). Design the approach/departure path so the minimum radius of the curve is 886 feet (270 m) and the curve follows a 1,000 feet (305 m) straight section. Design the approach/departure path so the combined length of the center line of the curved portion and the straight portion is 4,000 feet (1,219 m). See Figure 2–8. Figure 2–10 shows a curved approach/departure path for an 8:1 approach/departure surface.

Figure 2-7. VFR Heliport Approach/Departure and Transitional Surfaces: General Aviation

Figure 2–8. Curved Approach/Departure: General Aviation

Figure 2-9. VFR PPR Heliport Lateral Extension of the 8:1 Approach / Departure Surface: General Aviation

**Figure 2-10. VFR PPR Heliport Lateral Extension
of the Curved 8:1 Approach / Departure Surface: General Aviation**

d. Flight path alignment guidance. As an option, use flight path alignment markings and/or flight path alignment lights (see paragraphs 215 and 216) where it is desirable and practicable to indicate available approach and/or departure flight path direction(s). See Figure 2–11.

e. Periodic review of obstructions. Vigilant heliport operators reexamine obstacles in the vicinity of approach/departure paths on at least an annual basis. This reexamination includes an appraisal of the growth of trees near approach and departure paths. Paragraph 111 provides additional information on hazards to air navigation. Pay particular attention to obstacles that need to be marked or lighted. It may be helpful to maintain a list of the GPS coordinates and the peak elevation of obstacles.

211. Heliport protection zone (HPZ). The FAA recommends the establishment of an HPZ for each approach/departure surface. The HPZ is the area under the 8:1 approach/departure surface starting at the FATO perimeter and extending out for a distance of 280 feet (85.3 m), as illustrated in Figure 2–12. The HPZ is intended to enhance the protection of people and property on the ground. This is achieved through heliport owner control over the HPZ. Such control includes clearing HPZ areas (and maintaining them clear) of incompatible objects and activities. The FAA discourages residences and places of public assembly in an HPZ. (Churches, schools, hospitals, office buildings, shopping centers, and other uses with similar concentrations of persons typify places of public assembly.) Do not locate hazardous materials, including fuel, in the HPZ.

212. Wind cone.

a. Specification. Use a wind cone conforming to AC 150/5345-27, Specification for Wind Cone Assemblies, to show the direction and magnitude of the wind. Use a color that provides the best possible color contrast to its background.

b. Wind cone location. Locate the wind cone so it provides the pilot with valid wind direction and speed information in the vicinity of the heliport under all wind conditions.

(1) At many landing sites, there may be no single, ideal location for the wind cone. At other sites, it may not be possible to site a wind cone at the ideal location. In such cases, install more than one wind cone in order to provide the pilot with all the wind information needed for safe operations.

(2) Place the wind cone so a pilot on the approach path can see it clearly when the helicopter is 500 feet (150 m) from the TLOF.

(3) Place the wind cone so pilots can see it from the TLOF.

(4) To avoid presenting an obstruction hazard, locate the wind cone(s) outside the safety area, and so it does not penetrate the approach/departure or transitional surfaces.

c. Wind cone lighting. At a heliport intended for night operations, illuminate the wind cone, either internally or externally, to ensure it is clearly visible.

213. Taxiways and taxi routes. Taxiways and taxi routes provide for the movement of helicopters from one part of a landing facility to another. They provide a connecting path between the FATO and a parking area. They also provide a maneuvering aisle within the parking area. A taxi route includes the taxiway plus the appropriate clearances needed on both sides. The relationship between a taxiway and a taxi route is illustrated in Figure 2–13, Figure 2–14, and Figure 2–15. At heliports with no parking or refueling area outside the TLOF(s), it is not necessary to provide a taxi route or taxiway.

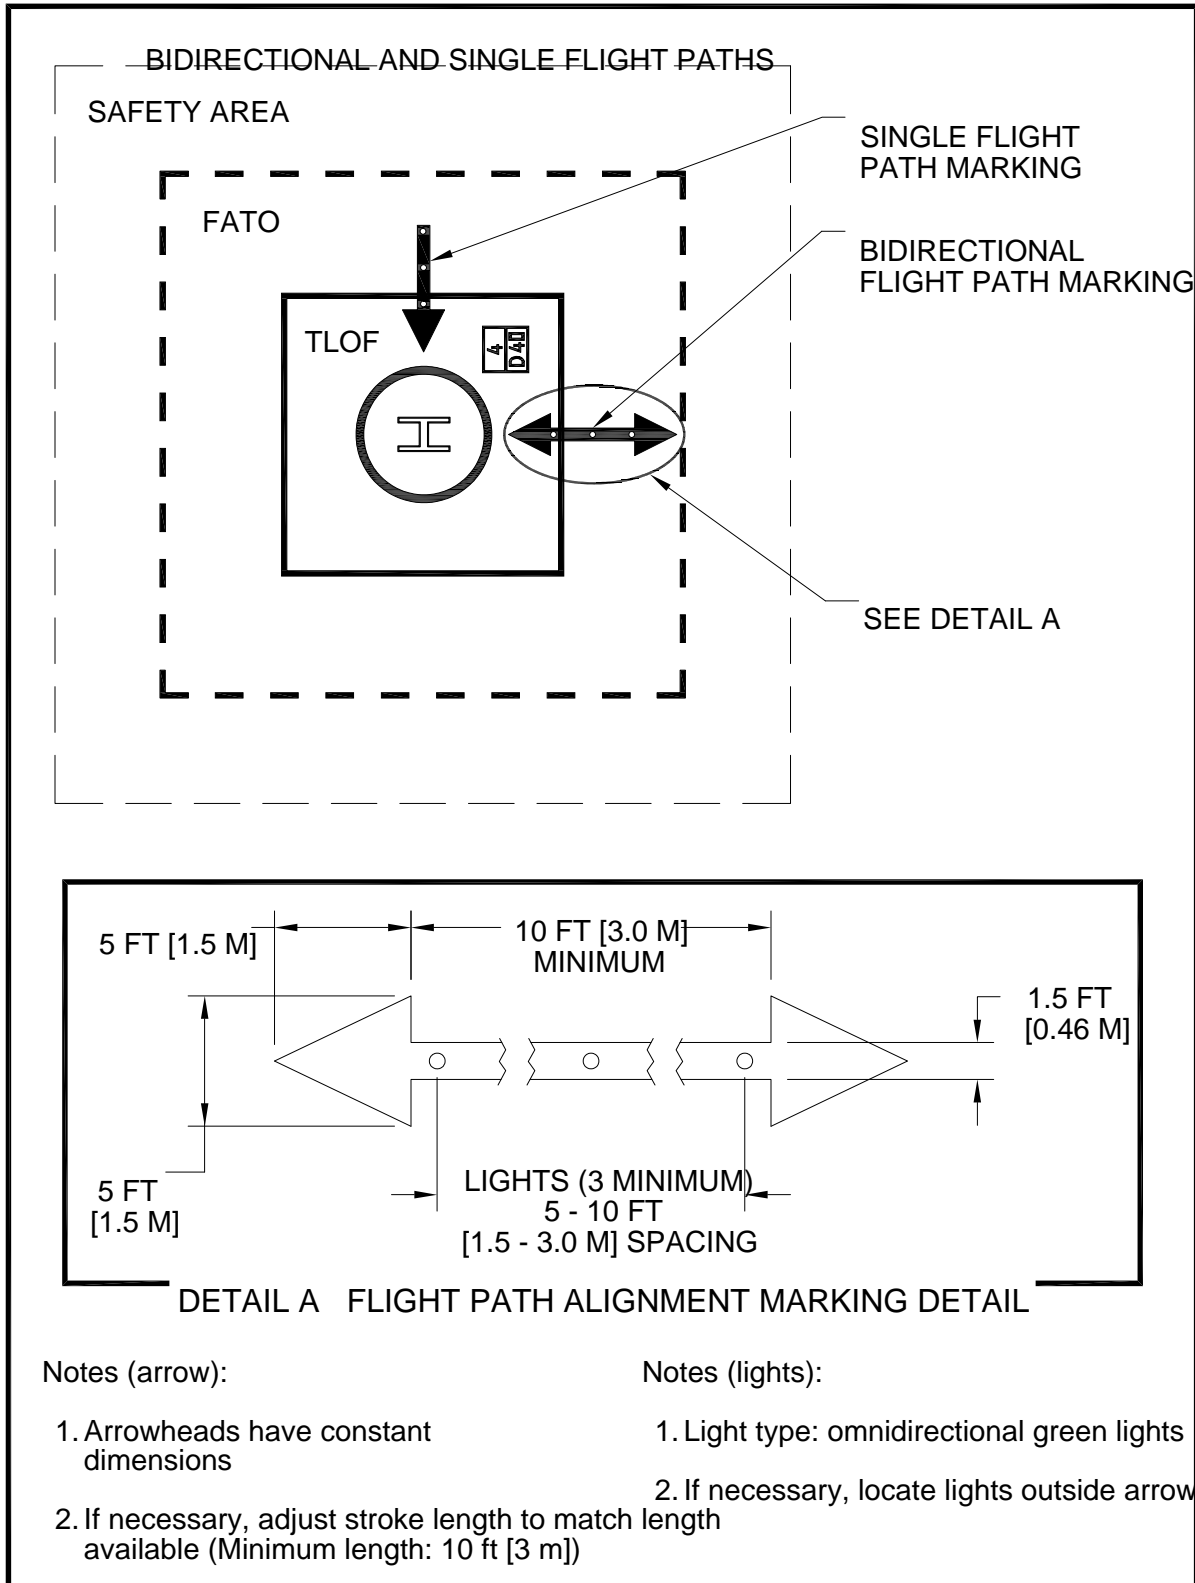

Figure 2-11. Flight Path Alignment Marking and Lights: General Aviation

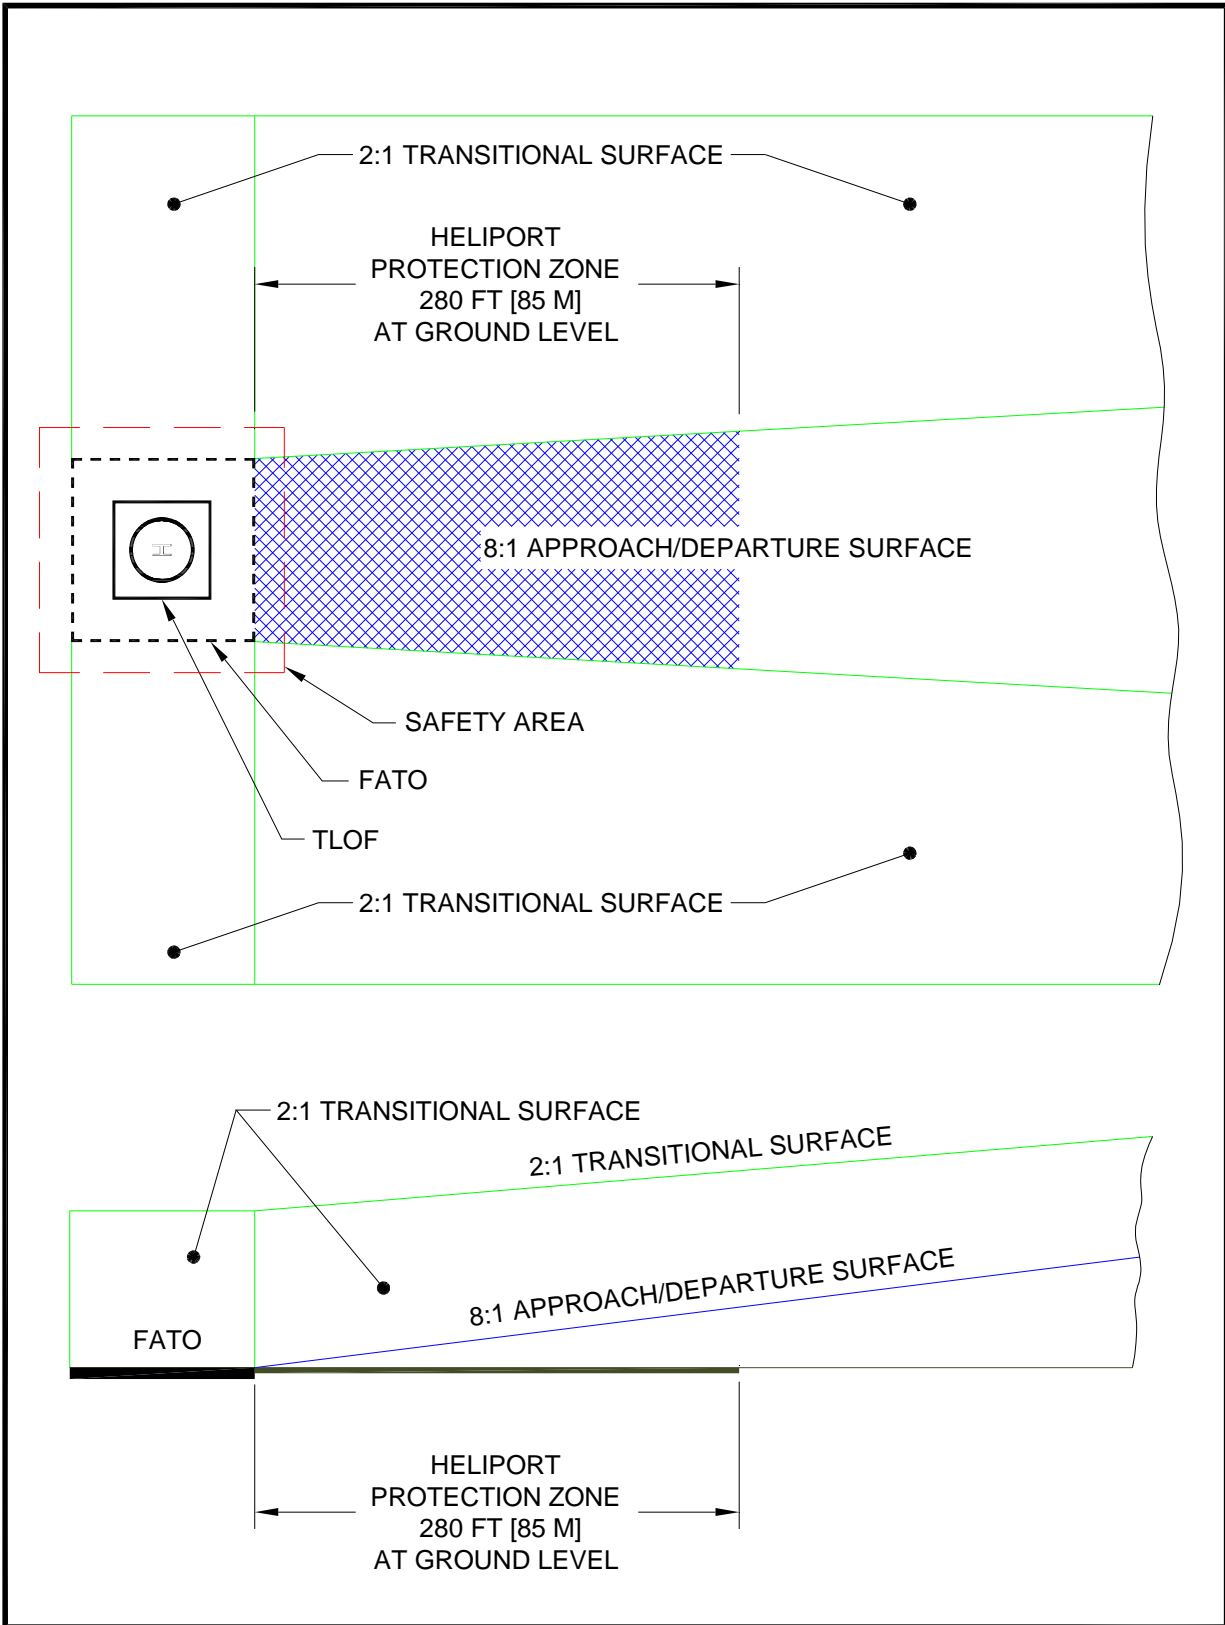

Figure 2-12. Heliport Protection Zone: General Aviation

Figure 2-13. Taxiway/Taxi Route Relationship – Paved Taxiway: General Aviation

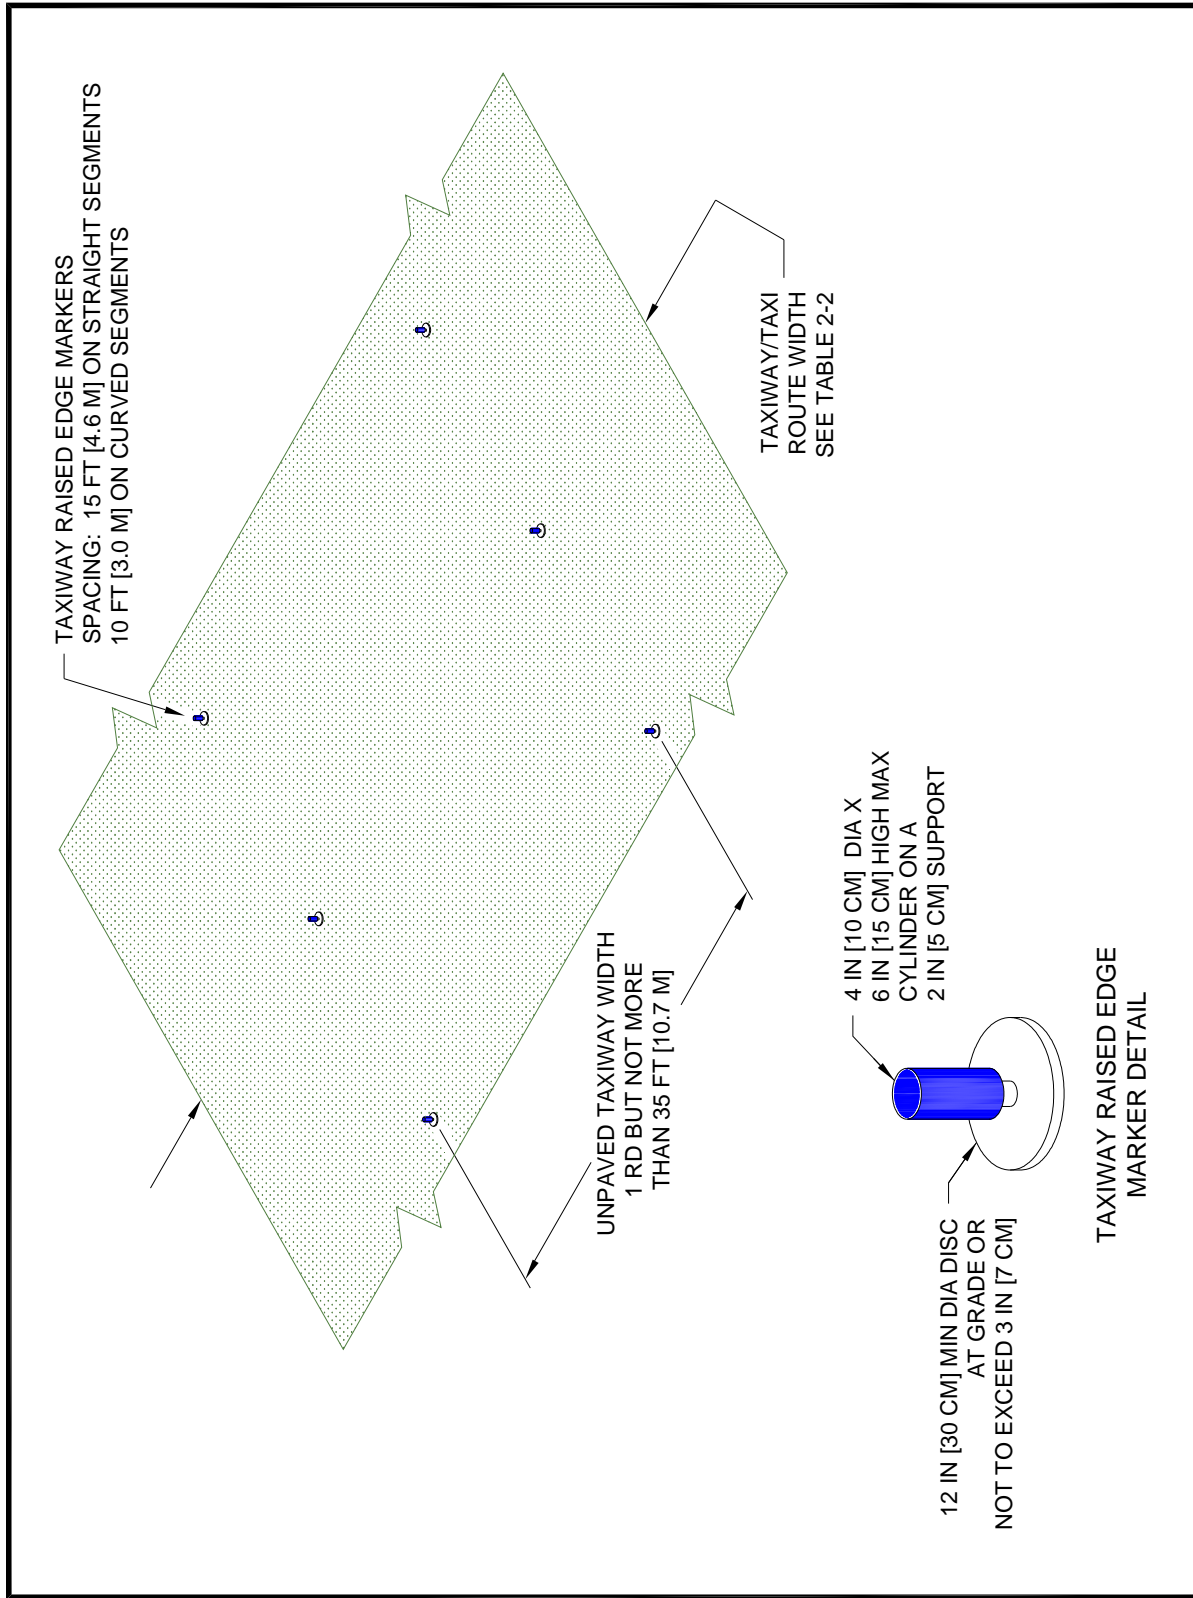

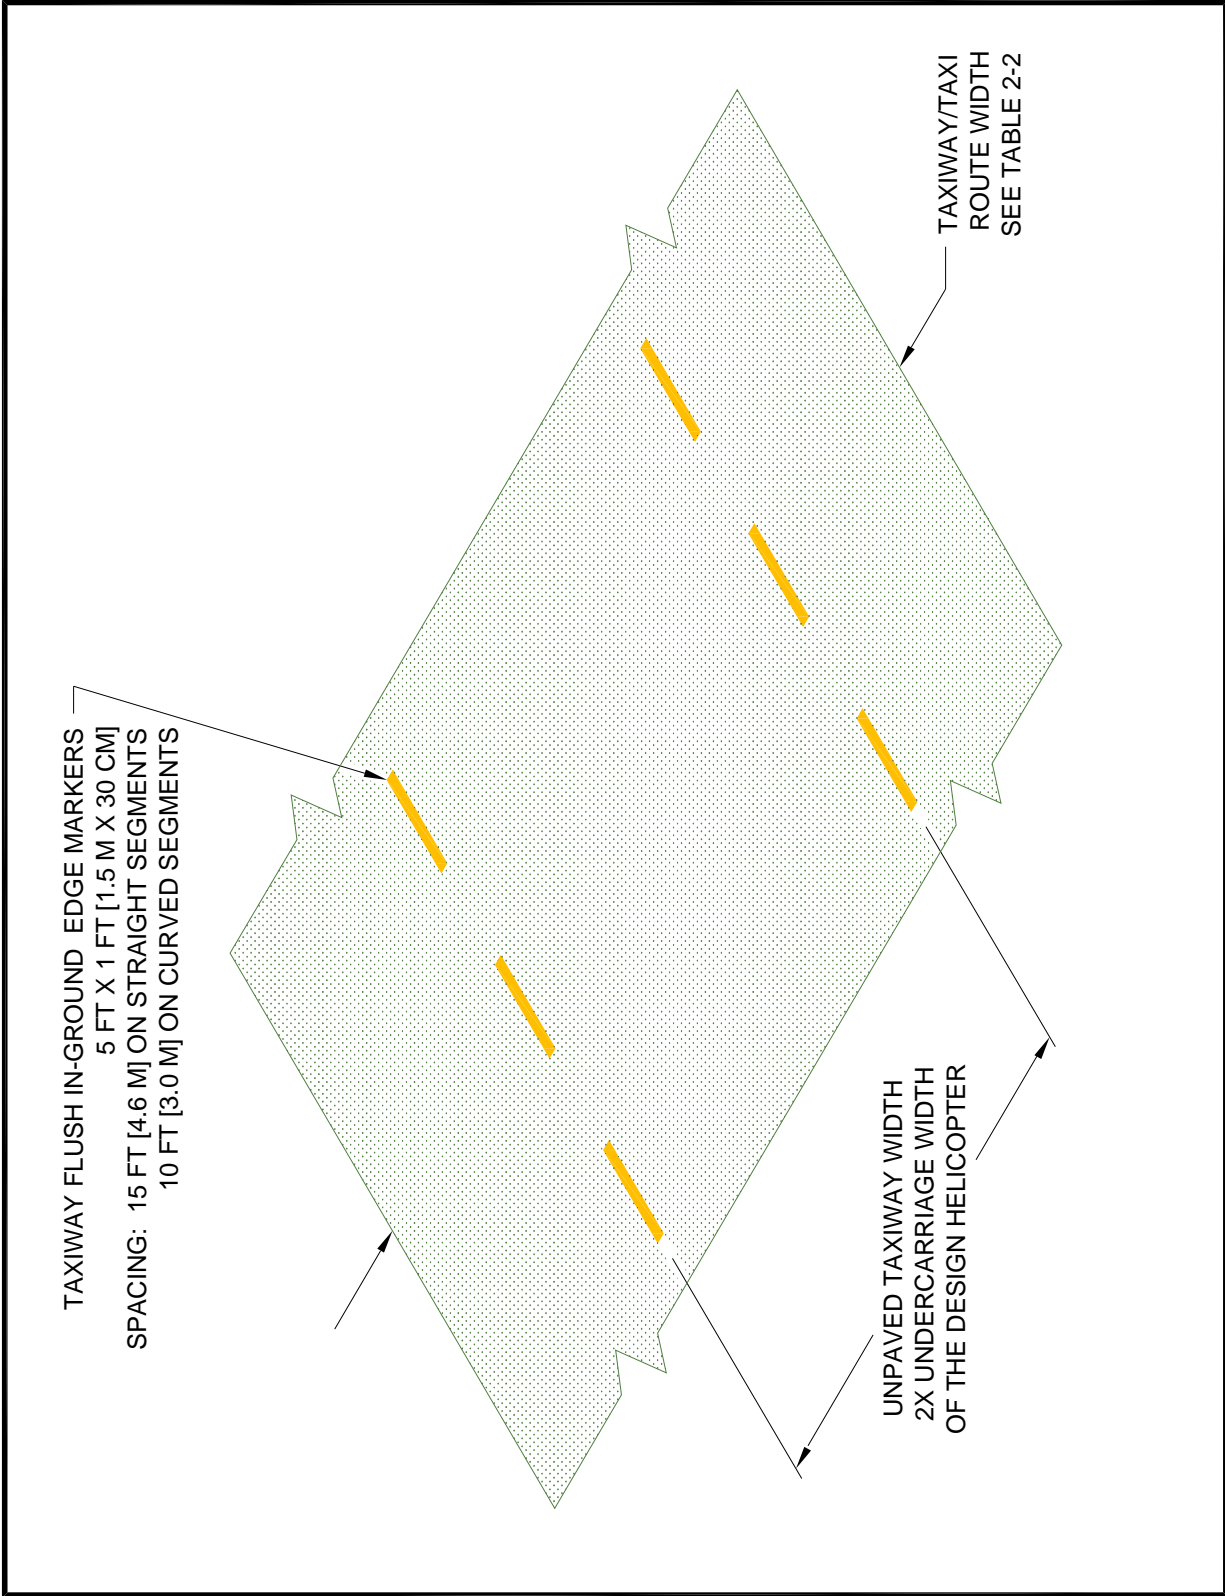

Figure 2-14. Taxiway/Taxi Route Relationship – Unpaved Taxiway with Raised Edge Markers: General Aviation

**Figure 2-15. Taxiway/Taxi Route Relationship –
Unpaved Taxiway with Flush Edge Markers: General Aviation**

a. Taxiway/taxi route widths. The dimensions of taxiways and taxi routes are a function of helicopter size, taxiway/taxi route marking, and type of taxi operations (ground taxi versus hover taxi). These dimensions are defined in Table 2-2. Normally, the requirement for hover taxi dictates the taxiway/taxi route widths. However, when the fleet comprises a combination of large ground taxiing helicopters and smaller air taxiing helicopters, the larger aircraft may dictate the taxiway/taxi route widths. If wheel-equipped helicopters taxi with wheels not touching the surface, design the facility with hover taxiway widths rather than ground taxiway widths. Where the visibility of the centerline marking cannot be guaranteed at all times, such as locations where snow or dust commonly obscure the centerline marking and it is not practical to remove it, determine the minimum taxiway/taxi route dimensions as if there was no centerline marking.

b. Surfaces. For ground taxiways, provide a portland cement concrete, asphalt, or stabilized surfaces, such as turf, in accordance with the standards of items P-217 of AC 150/5370-10. For unpaved portions of taxiways and taxi routes, provide a turf cover or treat the surface in some way to prevent dirt and debris from being raised by a taxiing helicopter's rotor wash.

c. Gradients. Taxiway and taxi route gradient standards are defined in Chapter 7.

214. Helicopter parking. If more than one helicopter at a time is expected at a heliport, design the facility with an area designated for parking helicopters. The size of this area depends on the number and size of specific helicopters to be accommodated. It is not necessary that every parking position accommodate the design helicopter. Construct individual parking positions to accommodate the helicopter size and weights expected to use the parking position at the facility. However, use the design helicopter to determine the separation between parking positions and taxi routes. Use the larger helicopter to determine the separation between parking positions intended for helicopters of different sizes. Build the parking positions to support the static loads of the helicopter intended to use the parking area. Design parking areas as one large, paved, apron or as individual, paved, parking positions. Ground taxi turns of wheeled helicopters are significantly larger than a hover turn. Consider the turn radius of helicopters when designing taxi intersections and parking positions for wheeled helicopters. Design heliport parking areas so helicopters will be parked in an orientation that keeps the "avoid areas" around the tail rotors clear of passenger walkways. See Figure 2-16, Figure 2-17, and Figure 2-19.

a. Location. Do not locate aircraft parking areas under an approach/departure surface. However, as an option, allow aircraft parking areas under the transitional surfaces.

(1) For "turn around" parking positions, locate the parking position to provide a minimum distance between the tail rotor circle and any object, building, safety area, or other parking position. The minimum distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or $\frac{1}{3}$ RD for hover taxi operations. See Figure 2-19.

(2) For "taxi-through" and "back-out" parking positions, locate the parking position to provide a minimum distance between the main rotor circle and any object, building, safety area, or other parking position. The minimum distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or $\frac{1}{3}$ RD for hover taxi operations. See Figure 2-20.

(3) Locate the parking position to provide a minimum distance between the main rotor circle and the edge of any taxi route. Design parking positions such that the helicopter taxis through, turns around, or backs out to depart. The minimum distance is $\frac{1}{3}$ RD for "turn around" and "taxi through" parking areas, and $\frac{1}{2}$ RD for "back-out" parking areas. See Figure 2-16, Figure 2-17, and Figure 2-18.

Table 2-2. Taxiway/Taxi Route Dimensions – General Aviation Heliports

Taxiway (TW) Type	Minimum Width of Paved Area	Centerline Marking Type	TW Edge Marking Type	Lateral Separation Between TW Edge Markings	Total Taxi Route Width
Ground Taxiway	2 x UC	Painted	Painted	2 x UC	1 ½ RD
			Elevated	1 RD but not greater than 35 ft (10.7 m)	
	Unpaved but stabilized for ground taxi	None	Flush	2 x UC	
			Elevated	1 RD but not greater than 35 ft (10.7 m)	
Hover Taxiway	2 x UC	Painted	Painted	2 x UC	2 RD
	Unpaved	None	Elevated or Flush	1 RD but not greater than 35 ft (10.7 m)	
RD: rotor diameter of the design helicopter TW: taxiway UC: undercarriage length or width (whichever is greater) of the design helicopter					

Figure 2–16. Parking Area Design – “Taxi-through” Parking Positions: General Aviation

Figure 2-17. Parking Area Design – “Turn-around” Parking Positions: General Aviation

Figure 2-18. Parking Area Design – “Back-out” Parking Positions: General Aviation

Figure 2-19. "Turn-around" Parking Position Marking: General Aviation

Figure 2–20. “Taxi-through” and “Back-out” Parking Position Marking: General Aviation

b. Size. Parking position sizes are dependent upon the helicopter size. The clearance between parking positions are dependent upon the type of taxi operations (ground taxi or hover taxi) and the intended paths for maneuvering in and out of the parking position. The more demanding requirement will dictate what is required at a particular site. Usually, the parking area requirements for skid-equipped helicopters will be the most demanding. However, when the largest helicopter is a very large, wheeled aircraft (for example, the S-61), and the skid-equipped helicopters are all much smaller, the parking requirements for wheeled helicopters may be the most demanding. If wheel-equipped helicopters taxi with wheels not touching the surface, design parking areas based on hover taxi operations rather than ground taxi operations.

(1) If all parking positions are the same size, design them to accommodate the largest helicopter that will park at the heliport.

(2) When there is more than one parking position, as an option design the facility with parking positions of various sizes with at least one position that will accommodate the largest helicopter that will park at the heliport. Design other parking positions to be smaller, for the size of the individual or range of individual helicopters parking at that position. Figure 2–21 provides guidance on parking position identification, size, and weight limitations.

(3) “Taxi-through” parking positions are illustrated in Figure 2–16. When using this design for parking positions, the heliport owner and operator take steps to ensure all pilots are informed that “turn-around” or “back-up” departures from the parking position are not permitted.

(4) “Turn-around” parking positions are illustrated in Figure 2–17.

(5) “Back-out” parking positions are illustrated in Figure 2–18. When using this design for parking positions, design the adjacent taxiway to accommodate hover taxi operations so the width of the taxiway will be adequate to support “back-out” operations.

c. Parking pads. When partially paving a parking area, design the smallest dimension of the paved parking pad to be a minimum of two times the maximum dimension (length or width, whichever is greater) of the undercarriage or the RD, whichever is less, of the largest helicopter that will use the parking position. Place the parking pad in the center of the parking position circle.

d. Walkways. At parking positions, provide marked walkways where practicable. Design the pavement to drain away from walkways.

e. Fueling. Design the facility to allow fueling with the use of a fuel truck or a specific fueling area with stationary fuel tanks.

(1) Various federal, state, and local requirements for petroleum handling facilities apply to systems for storing and dispensing fuel. Guidance is found in AC 150/5230-4, Aircraft Fuel Storage, Handling, and Dispensing on Airports. Additional information may be found in various National Fire Protection Association (NFPA) publications. For more reference material, see Appendix D.

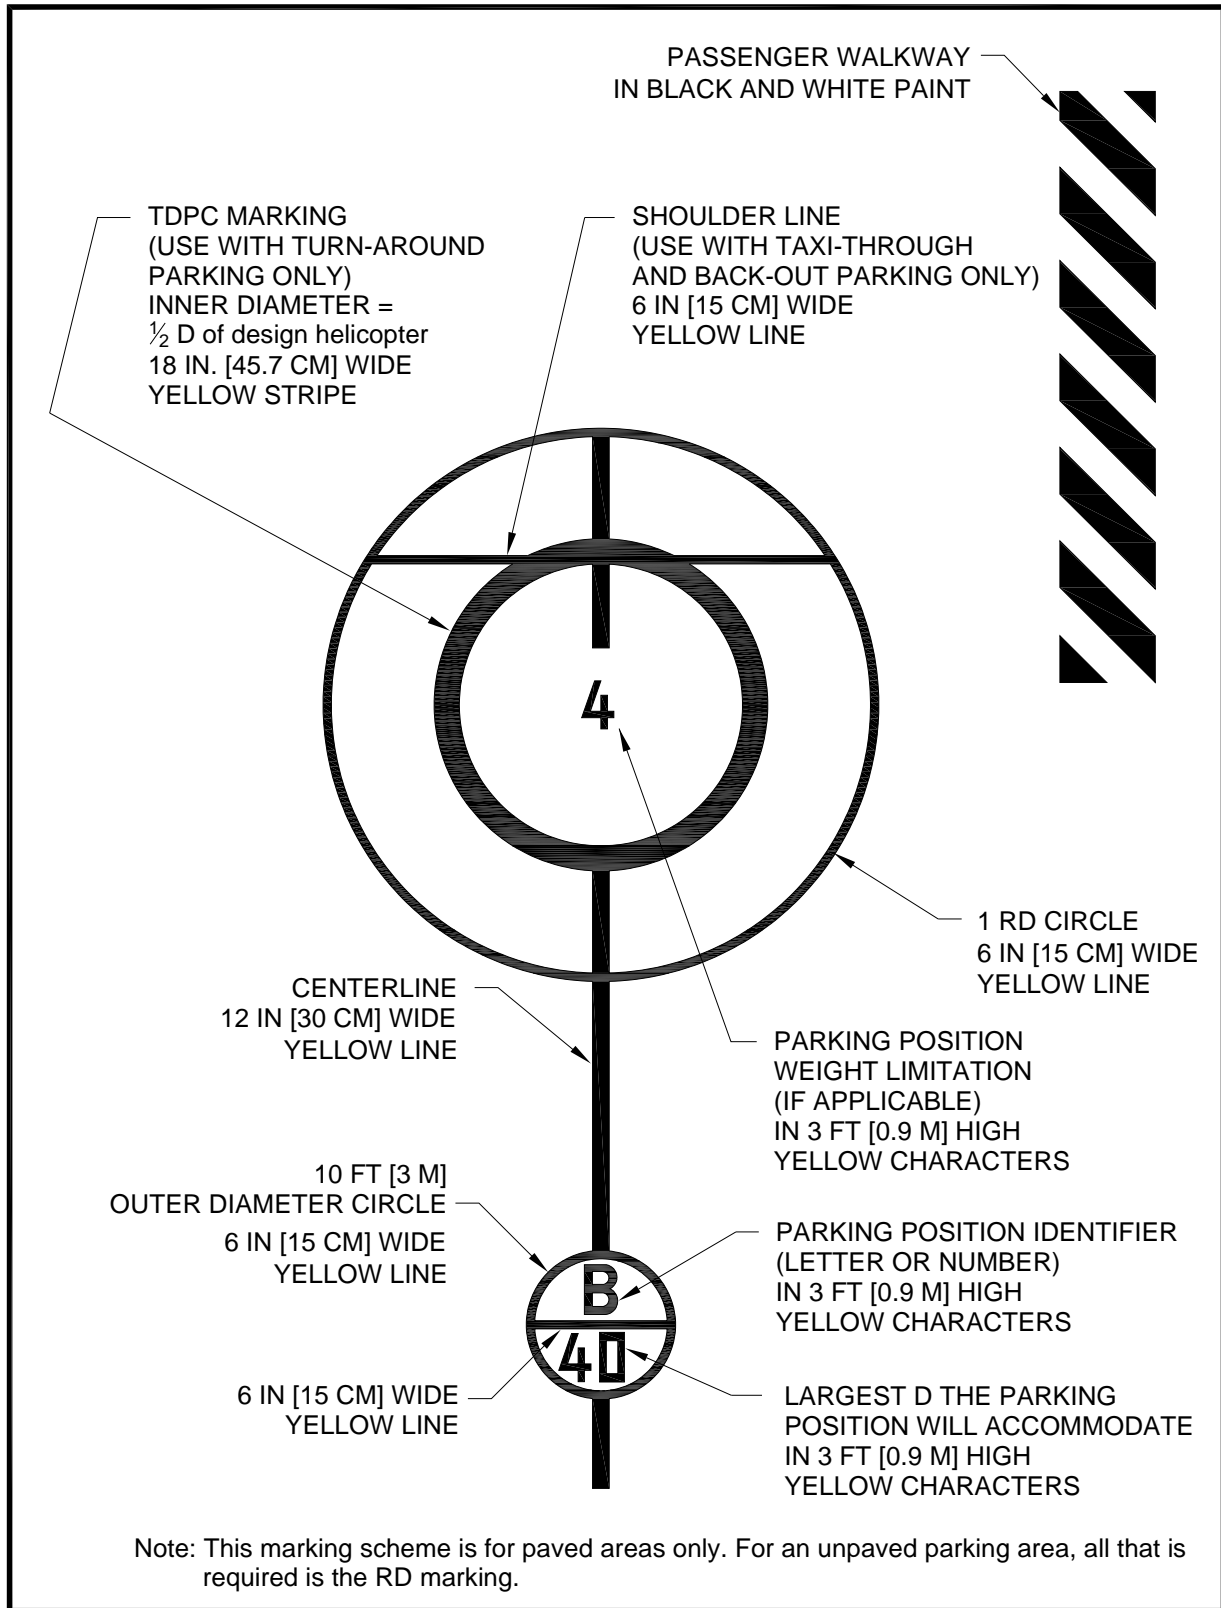

Figure 2–21. Parking Position Identification, Size, and Weight Limitations: General Aviation

(2) Do not locate fueling equipment in the TLOF, FATO, or safety area. Design and mark separate fueling locations to minimize the potential for helicopters to collide with the dispensing equipment. Design fueling areas so there is no object tall enough to be hit by the main or tail rotor blades within a distance of RD from the center point of the position where the helicopter would be fueled (providing $\frac{1}{2}$ RD clearance from the rotor tips). If this is not practical at an existing facility, install long fuel hoses.

(3) **Lighting.** Light the fueling area if night fueling operations are contemplated. Ensure any light poles do not constitute an obstruction hazard.

f. Tiedowns. Install recessed tiedowns to accommodate extended or overnight parking of based or transient helicopters. Recess any tiedowns so they will not be a hazard to helicopters. Ensure any depression associated with the tiedowns is of a diameter not greater than $\frac{1}{2}$ the width of the smallest helicopter landing wheel or landing skid anticipated to be operated on the heliport surface. In addition, provide storage for tiedown chocks, chains, cables and ropes off the heliport surface to avoid fouling landing gear. Find guidance on recessed tiedowns in AC 20-35, Tiedown Sense.

215. Heliport markers and markings. Markers and/or surface markings identify the facility as a heliport. Use paint or preformed materials for surface markings. (See AC 150/5370-10, Item P-620, for specifications for paint and preformed material.). As options, use reflective paint and reflective markers, though overuse of reflective material can be blinding to a pilot using landing lights. As an option, outline lines/markings with a 6-inch (15 cm) wide line of a contrasting color to enhance conspicuity. Place markings that define the edges of a TLOF, FATO, taxiway or apron within the limits of those areas. Use the following markers and markings.

a. Heliport identification marking. The identification marking identifies the location as a heliport, marks the TLOF and provides visual cues to the pilot.

(1) **Standard heliport identification symbol.** Mark the TLOF with a white “H” marking. The “H” has a minimum height of the lesser of 0.3 D or 10 feet (3 m). Locate the “H” in the center of the TLOF and orient it on the axis of the preferred approach/departure path. Place a one-foot wide bar under the “H” when it is necessary to distinguish the preferred approach/departure direction. The proportions and layout of the letter “H” are illustrated in Figure 2–23. For a height of “H” less than 10 feet (3 m), reduce other dimensions proportionately.

(2) **Nonstandard heliport identification marking.** As an option use a distinctive marking, such as a company logo, to identify the facility as a PPR heliport. However, a nonstandard marking does not necessarily provide the pilot with the same degree of visual cueing as the standard heliport identification symbol. To compensate, increase the size of the safety area when the standard heliport identification symbol “H” is not used. See Table 2-1.

b. TLOF markings.

(1) **TLOF perimeter marking.** Define the TLOF perimeter with markers and/or lines. If the heliport operator does not mark the TLOF, increase the size of the safety area as described in paragraph 209.a and Table 2-1.

(a) **Paved TLOFs.** Define the perimeter of a paved or hard surfaced TLOF with a continuous, 12-inch-wide (30 cm), white line. See Figure 2–25.

(b) **Unpaved TLOFs.** Define the perimeter of an unpaved TLOF with a series of 12-inch-wide (30 cm), flush, in-ground markers, each approximately 5 feet (1.5 m) in length with end-to-end spacing of not more than 6 inches (15 cm). See Figure 2–25.

(2) **Touchdown/positioning circle (TDPC) marking.** A TDPC marking provides guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot’s seat is over the

marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2}$ D and a line width of 18 in (46 m). Locate a TDPC marking in the center of a TLOF. (See Figure 2–23). As an option, at PPR heliports where the TLOF width is less than 16 feet (5 m), omit the TDPC marking.

(3) TLOF size and weight limitations. Mark the TLOF to indicate the length and weight of the largest helicopter it will accommodate, as shown in Figure 2–23. Place these markings in a box in the lower right-hand corner of a rectangular TLOF, or on the right-hand side of the “H” of a circular TLOF, when viewed from the preferred approach direction. The box is 5 feet (1.5 m) square. The numbers are 18 inches (46 cm) high. (See Figure C–1). If necessary, allow this marking to interrupt the TDPC marking. (See Figure 2–23 and Figure C–1.) The numbers are black with a white background. This marking is optional at a TLOF with a turf surface. This marking is also optional at PPR heliports, since the operator ensures all pilots using the facility are thoroughly knowledgeable with this and any other facility limitations.

(a) TLOF size limitation. This number is the length (D) of the largest helicopter the TLOF will accommodate, as shown in Figure 2–23. The marking consists of the letter “D” followed by the dimension in feet. Do not use metric equivalents for this purpose. Center this marking in the lower section of the TLOF size/weight limitation box.

(b) TLOF weight limitations. If a TLOF has limited weight-carrying capability, mark it with the maximum takeoff weight of the design helicopter, in units of thousands of pounds, as shown in Figure 2–23. Do not use metric equivalents for this purpose. Center this marking in the upper section of a TLOF size/weight limitation box. If the TLOF does not have a weight limit, add a diagonal line, extending from the lower left hand corner to the upper right hand corner, to the upper section of the TLOF size/weight limitation box. See Figure 2–23.

c. Extended pavement/structure markings. As an option, increase the pavement or structure without a corresponding increase in the length and width or diameter of the FATO to accommodate pedestrians and/or support operations. Whether or not this increased area is part of the LBA, mark the area outside the TLOF with 12-inch-wide (30 cm) diagonal black and white stripes. See Figure 2–24 for marking details.

d. FATO markings.

(1) FATO perimeter marking. Define the perimeter of a load-bearing FATO with markers and/or lines. Do not mark the FATO perimeter if any portion of the FATO is not a load-bearing surface. In such cases, mark the perimeter of the LBA (see paragraph (b) below).

(a) Paved FATO. Define the perimeter of a paved load-bearing FATO with a 12-inch-wide (30 cm) dashed white line. Define the corners of the FATO. The perimeter marking segments are approximately 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m). See Figure 2–25.

(b) Unpaved FATO. Define the perimeter of an unpaved load-bearing FATO with 12-inch-wide (30 cm), flush, in-ground markers. Define the corners of the FATO. The rest of the perimeter markers are approximately 5 feet (1.5 m) in length, and have end-to-end spacing of approximately 5 feet (1.5 m). See Figure 2–26.

**Figure 2-22. Standard and Alternate TLOF Marking:
General Aviation**

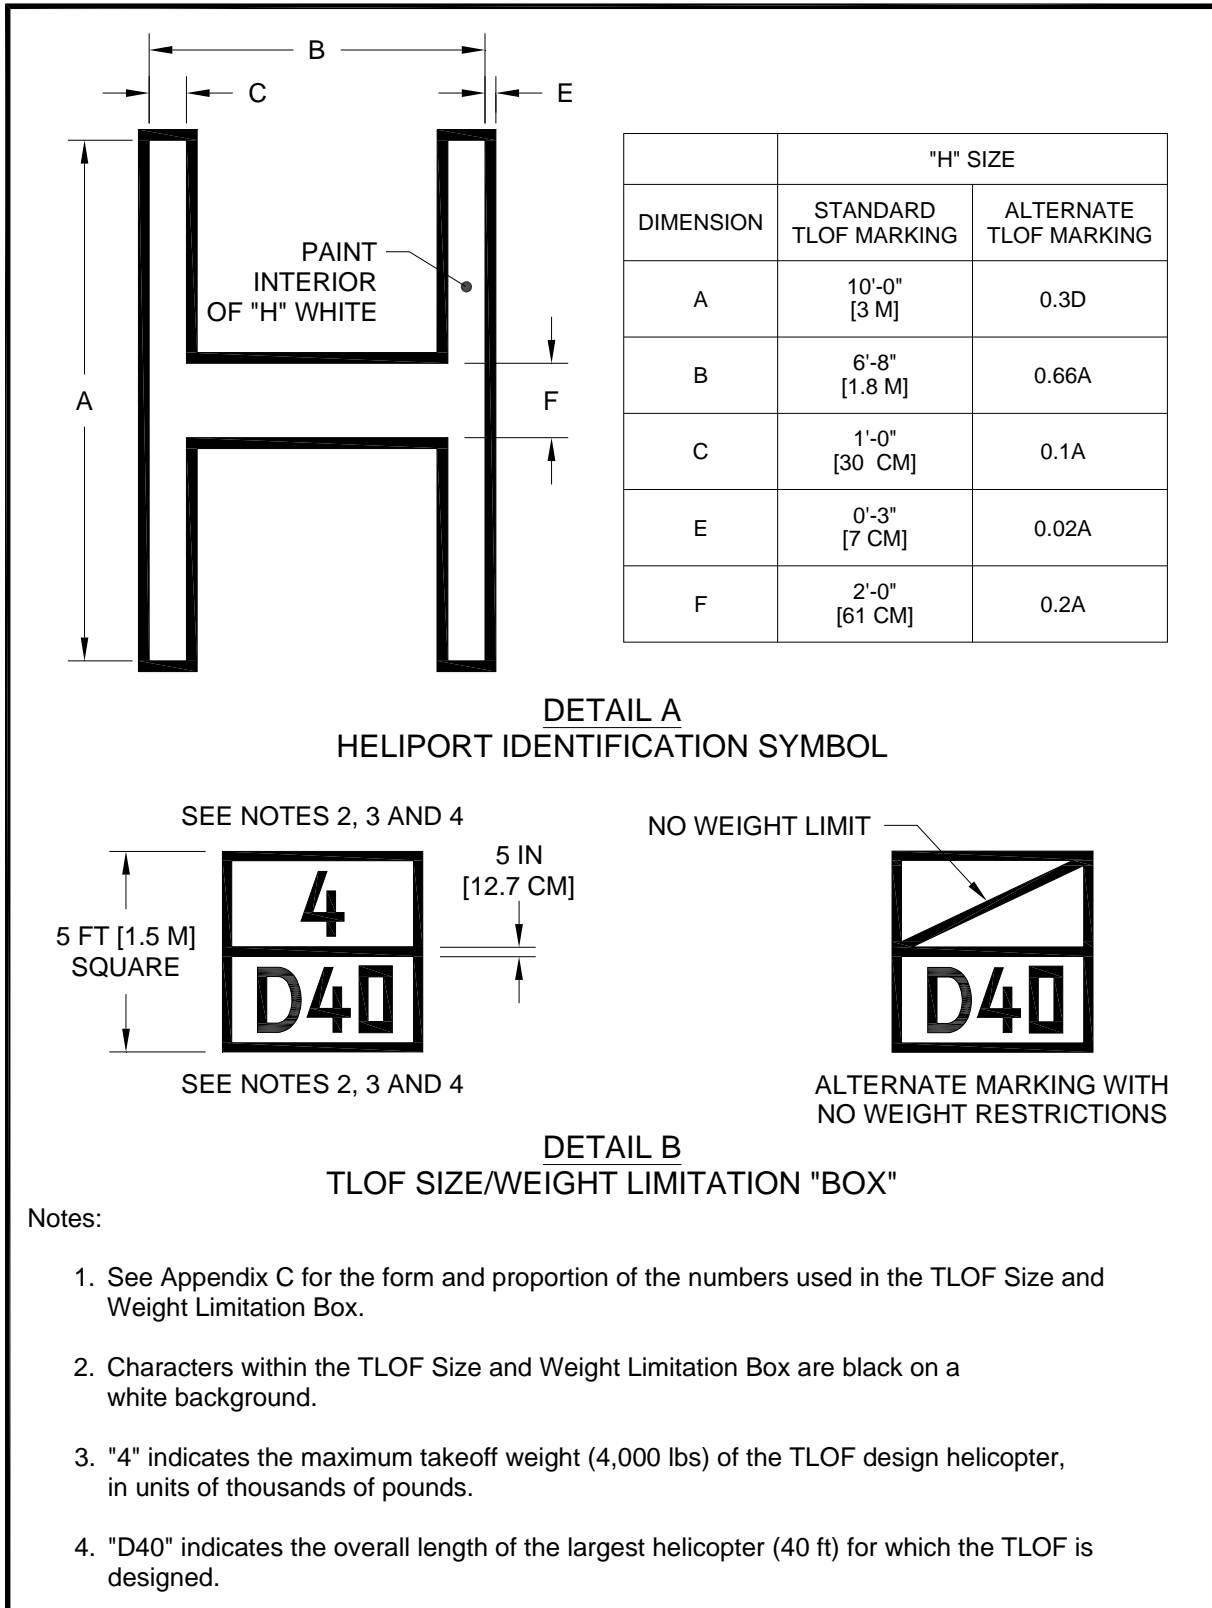

Figure 2-23. Standard Heliport Identification Symbol, TLOF Size and Weight Limitations: General Aviation

Figure 2–24. Extended Pavement / Structure Marking: General Aviation

**Figure 2–25. Paved TLOF/Paved FATO –
Paved TLOF/ Unpaved FATO – Marking: General Aviation**

Figure 2-26. Unpaved TLOF/Unpaved FATO – Marking: General Aviation

e. Flight path alignment guidance marking. An optional flight path alignment guidance marking consists of one or more arrows to indicate the preferred approach/departure direction(s). Mark it on the TLOF, FATO and/or safety area surface as shown in Figure 2–11. The shaft of the each arrow is 18 inches (50 cm) in width and at least 10 feet (3 m) in length. Use a color which provides good contrast against the background color of the surface. An arrow pointing toward the center of the TLOF depicts an approach direction. An arrow pointing away from the center of the TLOF depicts a departure direction. In the case of a flight path limited to a single approach direction or a single departure path, the arrow marking is unidirectional. In the case of a heliport with only a bidirectional approach/takeoff flight path available, the arrow marking is bidirectional.

f. Taxiway and taxi route markings.

(1) Paved taxiway markings. Mark the centerline of a paved taxiway with a continuous 6-inch (15 cm) yellow line. As an option, mark both edges of the paved portion of the taxiway with two continuous 6-inch (15 cm) wide yellow lines spaced 6 inches (15 cm) apart. Figure 2–13 illustrates taxiway centerline and edge markings.

(2) Unpaved taxiway markings. Use either raised or in-ground flush edge markers to provide strong visual cues to pilots. Space them longitudinally at approximately 15-foot (5 m) intervals on straight segments and at approximately 10-foot (3 m) intervals on curved segments. Figure 2–14 and Figure 2–15 illustrate taxiway edge markings.

(a) Raised-edge markers are blue, 4 inches (10 cm) in diameter, and 8 inches (20 cm) high, as illustrated in Figure 2–14.

(b) In-ground, flush edge markers are yellow, 12 inches (30 cm) wide, and approximately 5 feet (1.5 m) long.

(3) Raised edge markers in grassy areas. Tall grass sometimes obscures raised edge markers. Address this issue by using 12-inch (30 cm) diameter solid material disks around the poles supporting the raised markers.

(4) Taxiway to parking position transition requirements. For paved taxiways and parking areas, taxiway centerline markings continue into parking positions and become the parking position centerlines.

g. Helicopter parking position markings. Helicopter parking positions have the following markings:

(1) Paved parking position identifications. Mark parking position identifications (numbers or letters) if there is more than one parking position. These markings are yellow characters 36 inches (91 cm) high. See Figure 2–21 and Figure C–1.

(2) Rotor diameter circle. Define the circle of the RD of the largest helicopter that will park at that position with a 6-inch (15 cm) wide, solid yellow line with an outside diameter of RD. In paved areas, this is a painted line (see Figure 2–21). In unpaved areas, use a series of flush markers, 6 inches (15 cm) in width, a maximum of 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m).

(3) Touchdown/positioning circle (TDPC) marking. An optional TDPC marking provides guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot's seat is over the marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2} D$ and a line width of 18 in (46 cm). Locate a TDPC marking in the center of a parking area. See Figure 2–21 and Figure 2–25. The FAA recommends a TDPC marking for "turn-around" parking areas.

(4) Maximum length marking. This marking on paved surfaces indicates the D of the largest helicopter that the position is designed to accommodate (for example, 49). This marking consists of yellow characters at least 36 inches (91 cm) high. See Figure 2–21 and Figure C–1.

(5) Parking position weight limit. If a paved parking position has a weight limitation, mark it in units of 1,000 lbs as illustrated in Figure 2–21. (A 4 indicates a weight-carrying capability of up to 4,000 lbs. Do not use metric equivalents for this purpose.) This marking consists of yellow characters 36 inches (91 cm) high. When necessary to minimize the possibility of being misread, place a bar under the number. See Figure 2–21, Figure 2–25, and Figure C–1.

(6) Shoulder line markings. As an option, use shoulder line markings for paved parking areas (Figure 2–21) to ensure safe rotor clearance. Locate a 6-inch (15 cm) wide solid yellow shoulder line, perpendicular to the centerline and extending to the RD marking, so it is under the pilot's shoulder such that the main rotor of the largest helicopter the position will accommodate will be entirely within the rotor diameter parking circle (see Figure 2–21). Use $\frac{1}{4}$ D from the center of parking area to define the location of shoulder line. The FAA recommends a shoulder line marking for "taxi-through" and "back-out" parking areas.

h. Walkways. Figure 2–21 illustrates one marking scheme.

i. Closed heliport. Obliterate all markings of a permanently closed heliport, FATO, or TLOF. If it is impractical to obliterate markings, place a yellow "X" over the "H" as illustrated in Figure 2–27. Make the yellow "X" large enough to ensure early pilot recognition that the heliport is closed. Remove the wind cone(s) and other visual indications of an active heliport.

j. Marking sizes. See Appendix C for guidance on the proportions of painted numbers.

Figure 2–27. Marking a Closed Heliport: General Aviation

216. Helicopter lighting. If the heliport operator intends for the facility to support night operations, light it with FATO and/or TLOF perimeter lights as described below. Design flush light fixtures and installation methods to support point loads of the design helicopter transmitted through a skid or wheel.

a. TLOF perimeter lights. Use flush green lights meeting the requirements of FAA Airports Engineering Brief 87, Heliport Perimeter Light for Visual Meteorological Conditions (VMC), to define the TLOF perimeter. Use a minimum of 6. As an option at PPR facilities, use three light fixtures per side of a square or rectangular TLOF. Locate a light at each corner, with additional lights uniformly spaced between the corner lights. Using an odd number of lights on each side will place lights along the centerline of the approach. Define a circular TLOF using an even number of lights, with a minimum of eight, uniformly spaced. Space the lights at a maximum of 25 feet (7.6 m). Locate flush lights within 1 foot (30 cm) inside or outside of the TLOF perimeter.

(1) Raised TLOF perimeter lights. As an option, use raised, omnidirectional lights meeting the requirements of EB 87. Locate them on the outside edge of the TLOF or the outer edge of the safety net, as shown in Figure 2–28. Lighting on the outer edge of the safety net provides better visual cues to pilots at a distance from the heliport since it outlines a larger area. Make sure the raised lights do not penetrate a horizontal plane at the FATO elevation by more than 2 inches (5 cm). See Figure 7–3.

Figure 2–28. Elevated TLOF – Perimeter Lighting: General Aviation

(2) PPR facilities. Use flush lights for PPR heliports. As an option if only the TLOF is load bearing, use raised omnidirectional lights. Locate the raised lights outside and within 10 feet (3 m) of the edge of the TLOF. Make sure the lights do not penetrate a horizontal plane at the TLOF elevation by more than 2 inches (5 cm). As an option when the pavement or structure is larger than the TLOF, mount perimeter lights on the outer edge of the pavement or structure or the inner or outer edge of the safety net.

b. Load-bearing FATO perimeter lights. Green lights meeting the requirements of EB 87 define the perimeter of a load bearing FATO. Do not light the FATO perimeter if any portion of the FATO is not a load-bearing surface. Use a minimum of four. As an option at PPR facilities, use a minimum of three flush or raised light fixtures per side of a square or rectangular FATO. Locate a light at each corner, with additional lights uniformly spaced between the corner lights. Using an odd number of lights on each side will place lights along the centerline of the approach. To define a circular FATO, use an even number of lights, with a minimum of eight, uniformly spaced. Space lights at a maximum of 25 feet (7.6 m). Locate flush lights within 1 foot (30 cm) inside or outside of the FATO perimeter (See Figure 2–29). As an option, use a square or rectangular pattern of FATO perimeter lights even if the TLOF is circular. At a distance during nighttime operations, a square or rectangular pattern of FATO perimeter lights provides the pilot with better visual alignment cues than a circular pattern, but a circular pattern may be more effective in an urban environment. In the case of an elevated FATO with a safety net, mount the perimeter lights a similar manner as discussed in paragraph 215.a(1). As an option, locate raised FATO perimeter lights, no more than 8 inches (20 cm) high, 10 feet (3 m) from the FATO perimeter. (See Figure 2–30.) When a heliport on an airport is sited near a taxiway, there may be a concern that a pilot may confuse the green taxiway centerline lights with the FATO perimeter lights. As an option in such cases, use yellow lights as an alternative color for marking the FATO.

c. Floodlights. The FAA has not evaluated floodlights for effectiveness in visual acquisition of a heliport. However, if ambient light does not adequately illuminate markings for night operations, use floodlights to illuminate the TLOF, the FATO, and/or the parking area. If possible, mount these floodlights on adjacent buildings to eliminate the need for tall poles. Take care, however, to place floodlights clear of the TLOF, the FATO, the safety area, and the approach/departure surfaces, and transitional surfaces and ensure floodlights and their associated hardware do not constitute an obstruction hazard. Aim floodlights down to provide adequate illumination on the surface. Make sure floodlights that might interfere with pilot vision during takeoff and landings are capable of being turned off by pilot control or at pilot request.

d. Landing direction lights. As an option when it is necessary to provide directional guidance, install landing direction lights. Landing direction lights are a configuration of five green, omnidirectional lights meeting the standards of EB 87, on the centerline of the preferred approach/departure path. Space these lights at 15-foot (5 m) intervals beginning at a point not less than 20 feet (6 m) and not more than 60 feet (18 m) from the TLOF perimeter and extending outward in the direction of the preferred approach/departure path, as illustrated in Figure 2–31.

e. Flight path alignment lights. As an option, install flight path alignment lights meeting the requirements of EB 87. Place them in a straight line along the direction of approach and/or departure flight paths. If necessary, extend them across the TLOF, FATO, safety area or any suitable surface in the immediate vicinity of the FATO or safety area. Install three or more green lights spaced at 5 feet (1.5 m) to 10 feet (3.0 m). See Figure 2–11.

f. Taxiway and taxi route lighting.

(1) Taxiway centerline lights. Use flush bidirectional green lights meeting the standards of AC 150/5345-46, Specification for Runway and Taxiway Light Fixtures for type L-852A (straight segments) or L-852B (curved segments) to define taxiway centerlines. Space these lights at maximum 50-foot (15 m) longitudinal intervals on straight segments and at maximum 25-foot (7.6 m) intervals on curved segments, using a minimum of four lights to define the curve. Uniformly offset taxiway centerline lights

no more than two feet (0.6 m) if necessary to ease painting the taxiway centerline. As an option, use green retroreflective markers meeting requirements for Type I markers in AC 150/5345-39, Specification for L-853, Runway and Taxiway Retroreflective Markers, in lieu of the L-852A or L-852B lighting fixtures.

(2) Taxiway edge lights. Use omnidirectional blue lights to light the edges of a taxiway. As an option, use blue retroreflective markers to identify the edges of the taxiway in lieu of lights. Make sure retroreflective markers are no more than 8 inches (20 cm) tall.

(a) Straight segments. Space lights at 50-foot (15.2 m) longitudinal intervals on straight segments.

Figure 2–29. TLOF/FATO Flush Perimeter Lighting: General Aviation

Figure 2–30. TLOF Flush and FATO Raised Perimeter Lighting: General Aviation

Figure 2–31. Landing Direction Lights: General Aviation

(b) Curved segments. Curved taxiway edges require shorter spacing of edge lights. Base the spacing on the radius of the curve. AC 150/5340-30, Design and Installation Detail for Airport Visual Aids, shows the applicable spacing for curves. Space taxiway edge lights uniformly. On curved edges of more than 30 degrees from point of tangency (PT) of the taxiway section to PT of the intersecting surface, install at least three edge lights. For radii not listed in AC 150/5340-30, determine spacing by linear interpolation.

(c) Paved taxiways. Use flush lights meeting the standards of AC 150/5345-46 for type L-852T.

(d) Unpaved taxiways. Use raised lights meeting the standards of AC 150/5345-46 for type L-861T. The lateral spacing for the lights or reflectors is equal to the RD of the design helicopter, but not more than 35 feet (10.7 m).

g. Heliport identification beacon. A heliport identification beacon is optional equipment. It is the most effective means to aid the pilot in visually locating the heliport. Locate the beacon, flashing white/green/yellow at the rate of 30 to 45 flashes per minute, on or close to the heliport. Find guidance on heliport beacons in AC 150/5345-12, Specification for Airport and Heliport Beacon. As an option, allow the beacon to be pilot controllable such that it is “on” only when needed.

217. Marking and lighting of difficult-to-see objects. It is difficult for a pilot to see unmarked wires, antennas, poles, cell towers, and similar objects, even in the best daylight weather, in time to take evasive action. While pilots can avoid such objects during en route operations by flying well above them, approaches and departures require operations near the ground where obstacles may be a factor. This paragraph discusses the marking and lighting of objects near, but outside and below the approach/departure surface. Find guidance on marking and lighting objects in AC 70/7460-1, Obstruction Marking and Lighting.

a. Airspace. If difficult-to-see objects penetrate the applicable object identification surfaces illustrated in Figure 2-32 and Figure 2-33, mark these objects to make them more conspicuous. If a heliport supports operations between dusk and dawn, light these difficult-to-see objects. The object identification surfaces in Figure 2-32 and Figure 2-33 are described as follows:

(1) In all directions from the safety area except under the approach/departure paths, the object identification surface starts at the safety area perimeter and extends out horizontally for a distance of 100 feet (30.5 m).

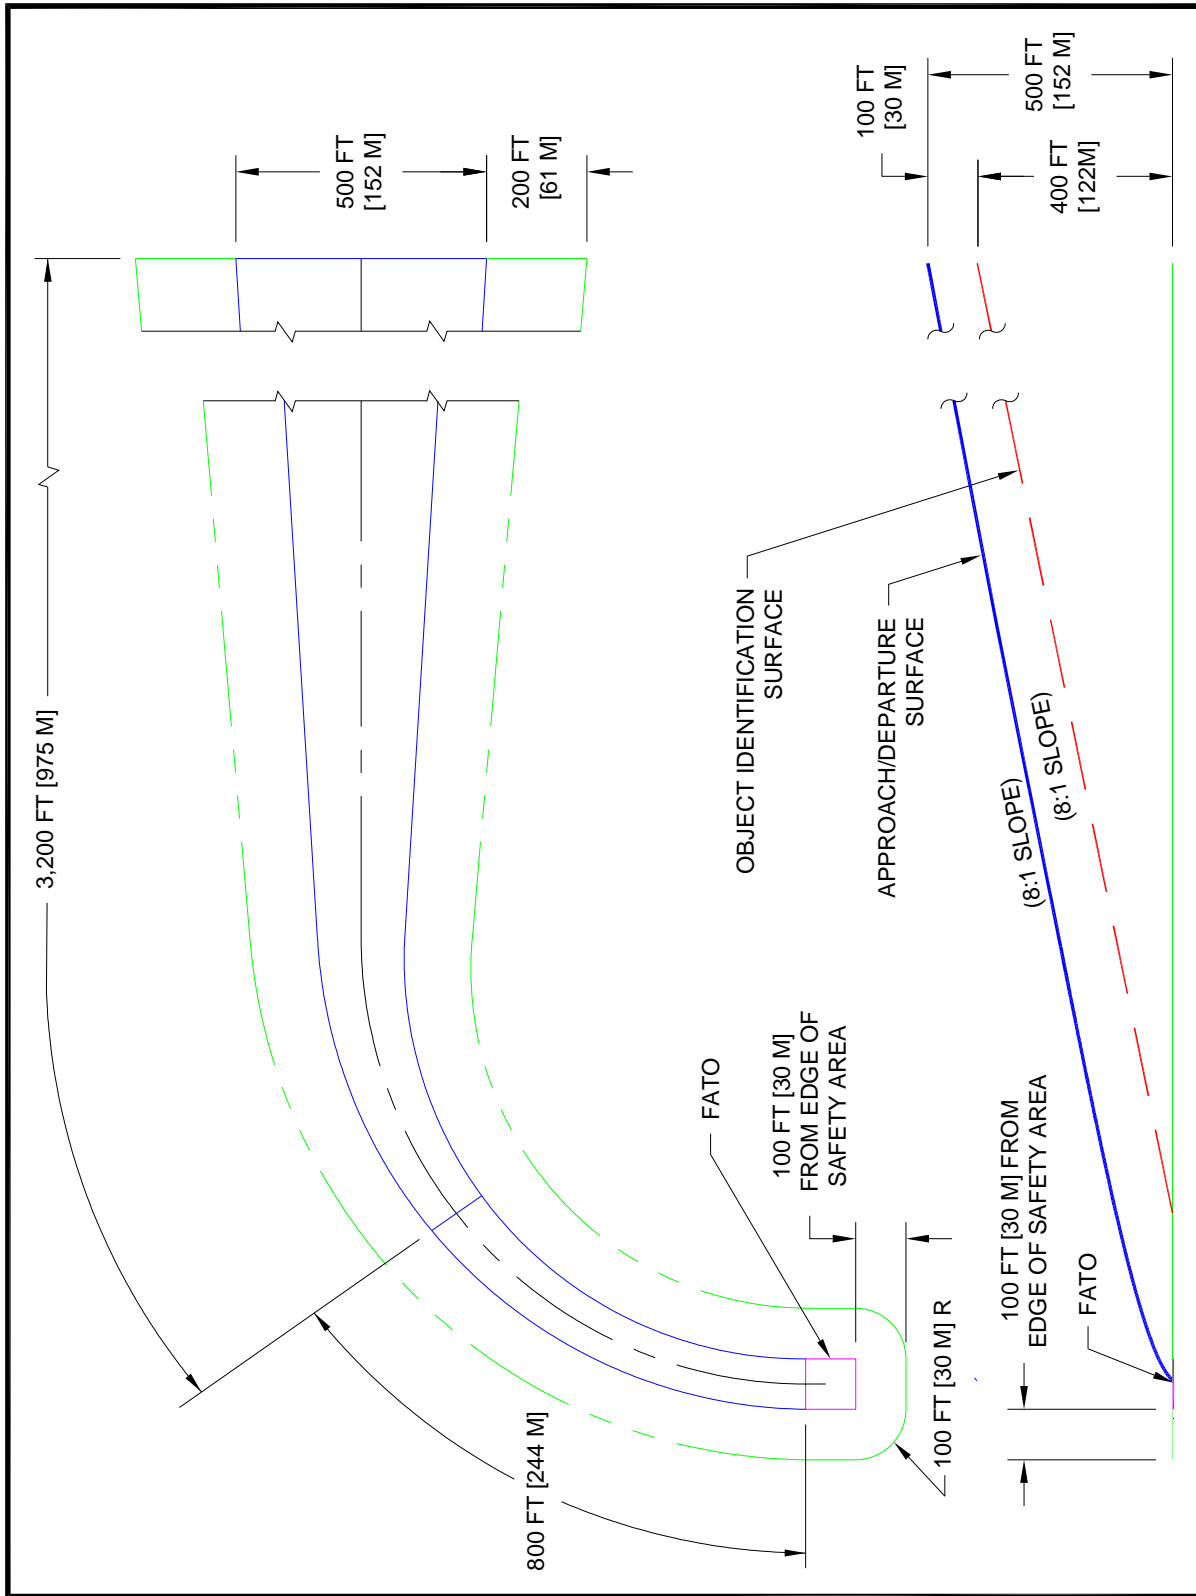

(2) Under the approach/departure surface, the object identification surface starts from the outside edge of the FATO and extends horizontally out for a distance of 800 feet (244 m) along the approach path. From this point, the object identification surface extends out for an additional distance of 3,200 feet (975 m) along the approach path while rising on an 8:1 slope (8 units horizontal in 1 unit vertical). From the point 800 feet (244 m) from the FATO perimeter, the object identification surface is 100 feet (30.5 m) beneath the approach/departure surface.

(3) The width of this object identification surface under the approach/departure surface increases as a function of distance from the safety area. From the safety area perimeter, the object identification surface extends laterally to a point 100 feet (30.5 m) outside the safety area perimeter. At the upper end of the surface, the object identification surface extends laterally 200 feet (61 m) on either side of the approach/departure path.

b. Shielding of objects. Title 14 CFR Part 77.9, Construction or alteration requiring notice, provides that if there are a number of objects close together, it may not be necessary to mark all of them if they are shielded. To meet the shielding guidelines, part 77 requires that an object “be shielded by existing structures of a permanent and substantial nature or by natural terrain or topographic features of equal or greater height, and will be located in the congested area of a city, town, or settlement where the shielded structure will not adversely affect safety in air navigation.”

**Figure 2–32. Airspace Where Marking and Lighting are Recommended:
Straight Approach: General Aviation**

**Figure 2-33. Airspace Where Marking and Lighting are Recommended:
Curved Approach: General Aviation**

c. Equipment/object marking. Make heliport maintenance and servicing equipment, as well as other objects used in the airside operational areas, conspicuous with paint, reflective paint, reflective tape, or other reflective markings. Reference AC 150/5210-5, Painting, Marking, and Lighting of Vehicles Used on an Airport.

218. Safety considerations. Consider the following safety enhancements in the design of a heliport. Address other areas, such as the effects of rotor downwash, based on site conditions and the design helicopter.

a. Security. Provide a heliport with appropriate means of keeping the operational areas clear of people, animals, and vehicles. Use a method to control access depending upon the helicopter location and types of potential intruders.

(1) Safety barrier. At ground-level general aviation heliports, erect a safety barrier around the helicopter operational areas in the form of a fence or a wall. Construct the barrier no closer to the operation areas than the outer perimeter of the safety area. Make sure the barrier does not penetrate any approach/departure (primary or transitional) surface. If necessary in the vicinity of the approach/departure paths, install the barrier well outside the outer perimeter of the safety area.

(2) Make sure any barrier is high enough to present a positive deterrent to persons inadvertently entering an operational area and yet low enough to be non-hazardous to helicopter operations.

(3) Control access to airside areas in a manner commensurate with the barrier (for example, build fences with locked gates). Display a cautionary sign similar to that illustrated in Figure 2–34 at access points.

b. Rescue and fire-fighting services. Heliports are subject to state and local rescue and fire-fighting regulations. Provide a fire hose cabinet or extinguisher at each access gate/door and each fueling location. Locate fire hose cabinets, fire extinguishers, and other fire-fighting equipment near, but below the level of, the TLOF. Find additional information in various NFPA publications. For more reference material, see Appendix D.

c. Communications. Use a Common Traffic Advisory Frequency (CTAF) radio to provide arriving helicopters with heliport and traffic advisory information but do not use this radio to control air traffic. Contact the Federal Communications Commission (FCC) for information on CTAF licensing.

d. Weather information. An automated weather observing system (AWOS) measures and automatically broadcasts current weather conditions at the heliport site. When installing an AWOS, locate it at least 100 feet (30 m) and not more than 700 feet (213 m) from the TLOF and such that its instruments will not be affected by rotor wash from helicopter operations. Find guidance on AWOS systems in AC 150/5220-16, Automated Weather Observing Systems (AWOS) for Non-Federal Applications, and FAA Order 6560.20, Siting Criteria for Automated Weather Observing Systems (AWOS). Other weather observing systems will have different siting criteria.

e. Winter operations. Swirling snow raised by a helicopter's rotor wash can cause the pilot to lose sight of the intended landing point and/or hide objects that need to be avoided. Design the heliport to accommodate the methods and equipment used for snow removal. Design the heliport to allow the snow to be removed sufficiently so it will not present an obstruction hazard to the tail rotor, main rotor, or undercarriage. Find guidance on winter operations in AC 150/5200-30, Airport Winter Safety and Operations.

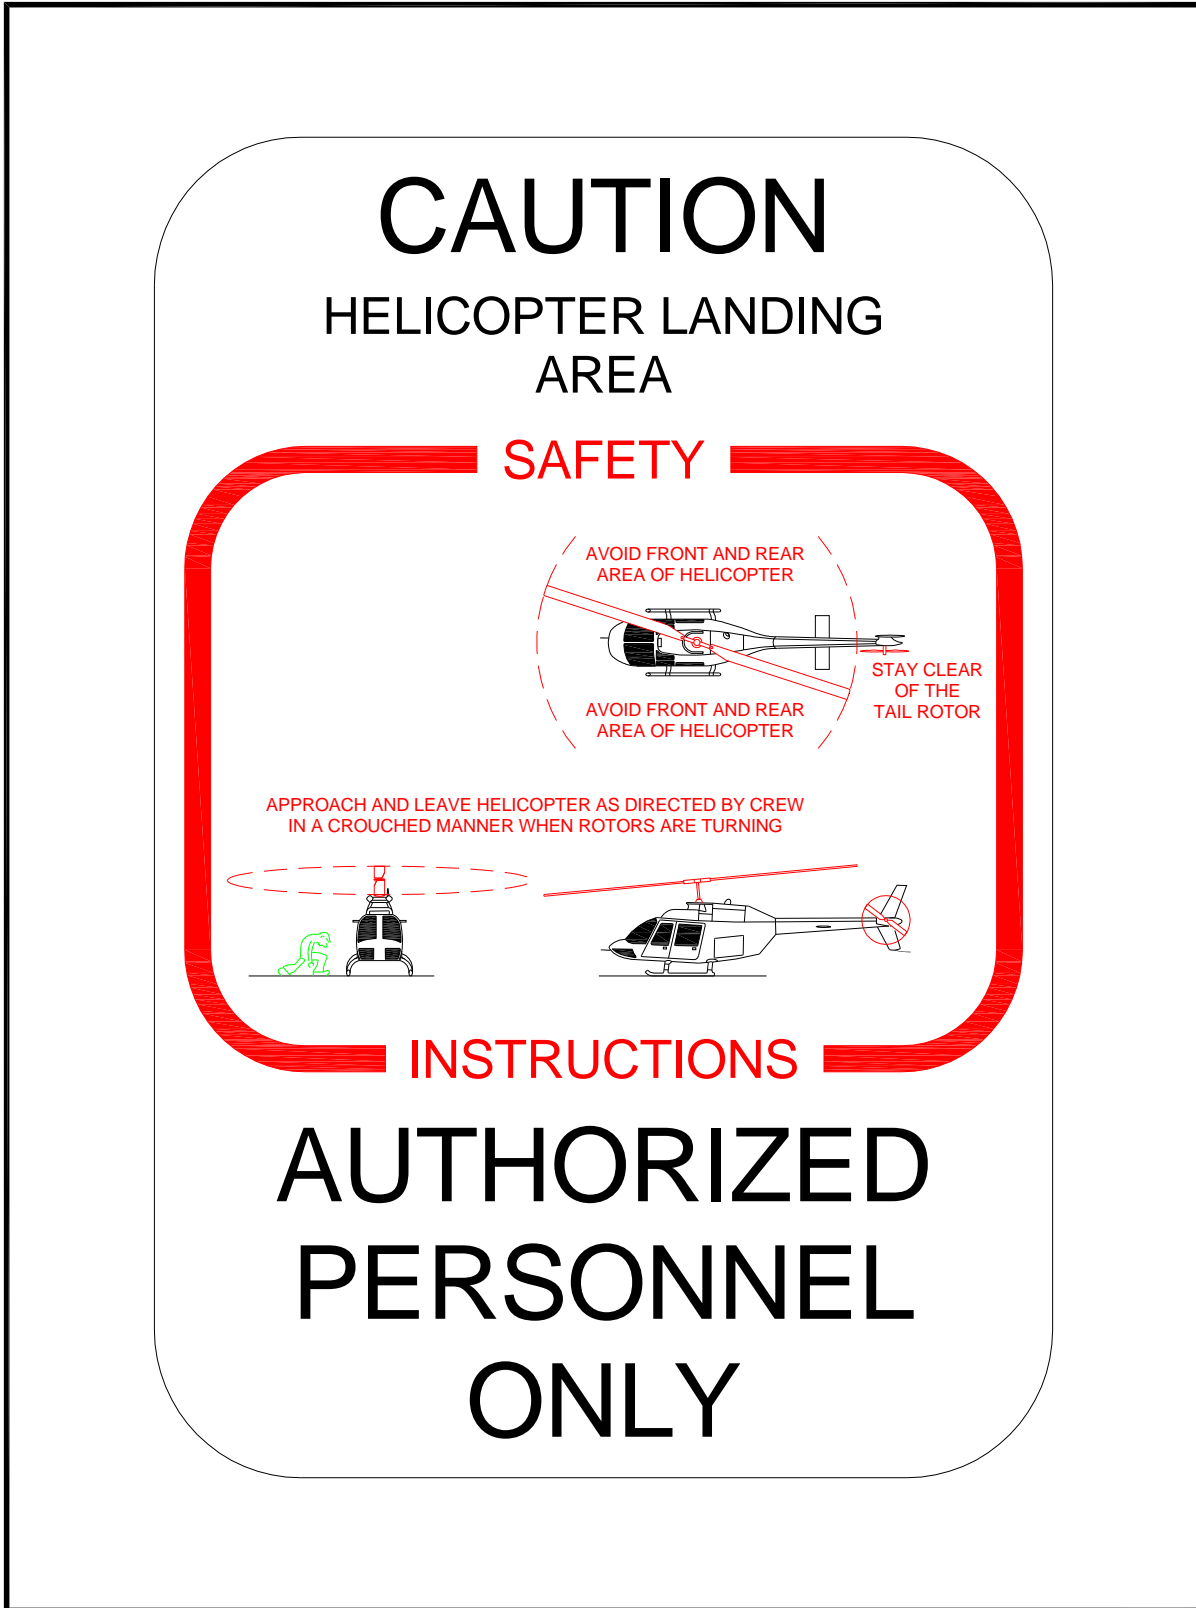

Figure 2–34. Caution Sign: General Aviation

Figure 2-35. Visual Glideslope Indicator Siting and Clearance Criteria: General Aviation

219. Visual glideslope indicators (VGSI). A visual glideslope indicator (VGSI) provides pilots with visual vertical course and descent cues. Install the VGSI such that the lowest on-course visual signal provides a minimum of 1 degree of clearance over any object that lies within 10 degrees of the approach course centerline.

a. Siting. The optimum location of a VGSI is on the extended centerline of the approach path at a distance that brings the helicopter to a hover with the undercarriage between 3 and 8 feet (0.9 to 2.5 m) above the TLOF. Figure 2–35 illustrates VGSI clearance criteria. To properly locate the VGSI, estimate the vertical distance from the undercarriage to the pilot’s eye.

b. Control of the VGSI. As an option, allow the VGSI to be pilot controllable such that it is “on” only when needed.

c. VGSI needed. A VGSI is an optional feature. However, provide a VGSI if one or more of the following conditions exist, especially at night:

(1) Obstacle clearance, noise abatement, or traffic control procedures require a particular slope to be flown.

(2) The environment of the heliport provides few visual surface cues.

d. Additional guidance. Find additional guidance in AC 150/5345-52, Generic Visual Glideslope Indicators (GVGI), and AC 150/5345-28, Precision Approach Path Indicator (PAPI) Systems.

220. Terminal facilities. A heliport terminal provides curbside access for passengers using private autos, taxicabs, and public transit vehicles. Public waiting areas need the usual amenities, and a counter for rental car services may be desirable. Design passenger auto parking areas to accommodate current requirements, with the ability to expand them to meet future requirements. Readily available public transportation may reduce the requirement for employee and service personnel auto parking spaces. Build attractive and functional heliport terminal buildings or sheltered waiting areas. Find guidance on designing terminal facilities in AC 150/5360-9, Planning and Design of Airport Terminal Building Facilities at Non-Hub Locations. At PPR heliports, the number of people using the facility may be so small that there is no need for a terminal building, and minimal needs for other facilities and amenities.

221. Zoning and compatible land use. The FAA encourages general aviation heliport operators to promote the adoption of the following zoning measures where state and local statutes permit to ensure the heliport will continue to be available and to protect the investment in the facility.

a. Zoning to limit building/object heights. Find general guidance on drafting an ordinance that would limit building and object heights in AC 150/5190-4, A Model Zoning Ordinance to Limit Height of Objects Around Airports. Substitute the heliport surfaces for the airport surfaces in the model ordinance.

b. Zoning for compatible land use. The FAA encourages public agencies to enact zoning ordinances to control the use of property within the HPZ and the approach/departure path environment, restricting activities to those that are compatible with helicopter operations. See paragraph 211.

c. Air rights and property easements. Use air rights and property easements as options to prevent the encroachment of obstacles in the vicinity of a heliport.

Chapter 3. Transport Heliports

301. General. A transport heliport is intended to accommodate air carrier operators providing scheduled service, or unscheduled service with large helicopters.

302. Applicability. The standards in this chapter apply to projects funded under the Airport Improvement Program (AIP) or Passenger Facility Charge (PFC) program. For other projects/heliports, these standards are the FAA's recommendations for designing all transport heliports. The design standards in this chapter assume there will never be more than one helicopter within the final approach and takeoff area (FATO) and the associated safety area. If there is a need for more than one touchdown and lift-off area (TLOF) at a heliport, locate each TLOF within its own FATO and within its own safety area. Figure 3-1 illustrates a typical transport heliport.

303. Access by individuals with disabilities. Various laws require heliports operated by public entities and those receiving federal financial assistance to meet accessibility requirements. See paragraph 114.

304. Heliport site selection.

a. Long term planning. Public agencies and others planning to develop a transport heliport consider the possible future need for instrument operations and future expansion.

b. Property requirements. The property needed for a transport heliport depends upon the volume and types of users and the scope of amenities provided. Property requirements for helicopter operators and for passenger amenities frequently exceed that required for "airside" purposes.

c. Turbulence. Air flowing around and over buildings, stands of trees, terrain irregularities, etc. can create turbulence on ground-level and roof-top heliports that may affect helicopter operations. Where the FATO is located near the edge and top of a building or structure, or within the influence of turbulent wakes from other buildings or structures, assess the turbulence and airflow characteristics in the vicinity of, and across the surface of the FATO to determine if an air-gap between the roof, roof parapet or supporting structure, and/or some other turbulence mitigating design measure is necessary. FAA Technical Report FAA/RD-84/25, Evaluating Wind Flow around Buildings on Heliport Placement addresses the wind's effect on helicopter operations. Take the following actions in selecting a site to minimize the effects of turbulence.

(1) Ground-level heliports. Features such buildings, trees, and other large objects can cause air turbulence and affect helicopter operations from sites immediately adjacent to them. Therefore, locate the landing and takeoff area away from such objects in order to minimize air turbulence in the vicinity of the FATO and the approach/departure paths.

(2) Elevated heliports. Establishing a 6 foot (1.8 m) or more air gap on all sides above the level of the roof will generally minimize the turbulent effect of air flowing over the roof edge. If an air gap is included in the design, keep it free at all times of objects that would obstruct the airflow. If it is not practical to include an air gap or some other turbulence mitigating design measure where there is turbulence, operational limitations may need to be considered under certain wind conditions (see paragraph 101).

d. Electromagnetic effects. Nearby electromagnetic devices, such as a large ventilator motor, elevator motor or other large electrical consumer may cause temporary aberrations in the helicopter magnetic compass and interfere with other onboard navigational equipment.

Figure 3-1. Typical Transport Heliport: Transport

305. Basic layout. The heliport consists of a TLOF contained within a FATO. A safety area surrounds the FATO. The relationship of the TLOF to the FATO and the safety area is shown in Figure 3–2. A FATO contains only one TLOF. Provide appropriate approach/departure airspace to allow safe approaches to and departures from landing sites. To the extent feasible, align the preferred approach/departure path with the predominant winds (see paragraph 309). Where helicopter flight manuals specify the minimum size required for operations, take the size into account in the design of the facility.

306. Touchdown and liftoff area (TLOF).

a. TLOF location. The TLOF of a transport heliport is normally at ground level but may be developed with the TLOF located on a pier or, when carefully planned, on the roof of a building. The TLOF is centered in the load-bearing area (LBA), and on the major axis of the FATO.

b. TLOF size. The TLOF is a square or rectangular surface whose minimum length and width is the rotor diameter (RD) of the design helicopter but not less than 50 feet (15.2 m). Increasing the LBA centered on the TLOF may provide some safety and operational advantages.

c. Elongated TLOF: An elongated TLOF can provide an increased safety margin and greater operational flexibility. As an option, design an elongated TLOF with a landing position in the center and two takeoff positions, one at either end, as illustrated in Figure 3–3. Design the landing position to have a minimum length of the RD of the design helicopter, but not less than 50 feet (15.2 m). If the TLOF is elongated, also provide an elongated FATO.

d. Ground-level TLOF surface characteristics.

(1) Design loads. Design the TLOF and any supporting TLOF structure to be capable of supporting the dynamic loads of the design helicopter.

(2) Paving. Construct the TLOF of portland cement concrete (PCC) (see AC 150/5370-10, Standards for Specifying Construction of Airports items P-501) where feasible. Use a broomed or roughened pavement finish to provide a skid-resistant surface for helicopters and non-slippery footing for people.

e. Rooftop and other elevated TLOFs.

(1) Design loads. Design elevated TLOFs and any TLOF supporting structure to be capable of supporting the dynamic loads of the design helicopter. An elevated heliport is illustrated in Figure 3–4.

(2) TLOF surface characteristics. Construct rooftop and other elevated heliport TLOFs of metal, concrete, or other materials subject to local building codes. Provide TLOF surfaces with a skid-resistant surface finish for helicopters and non-slippery footing for people.

f. TLOF gradients. Recommended TLOF gradients are defined in Chapter 7.

Figure 3–2. TLOF/FATO Safety Area Relationships and Minimum Dimensions: Transport

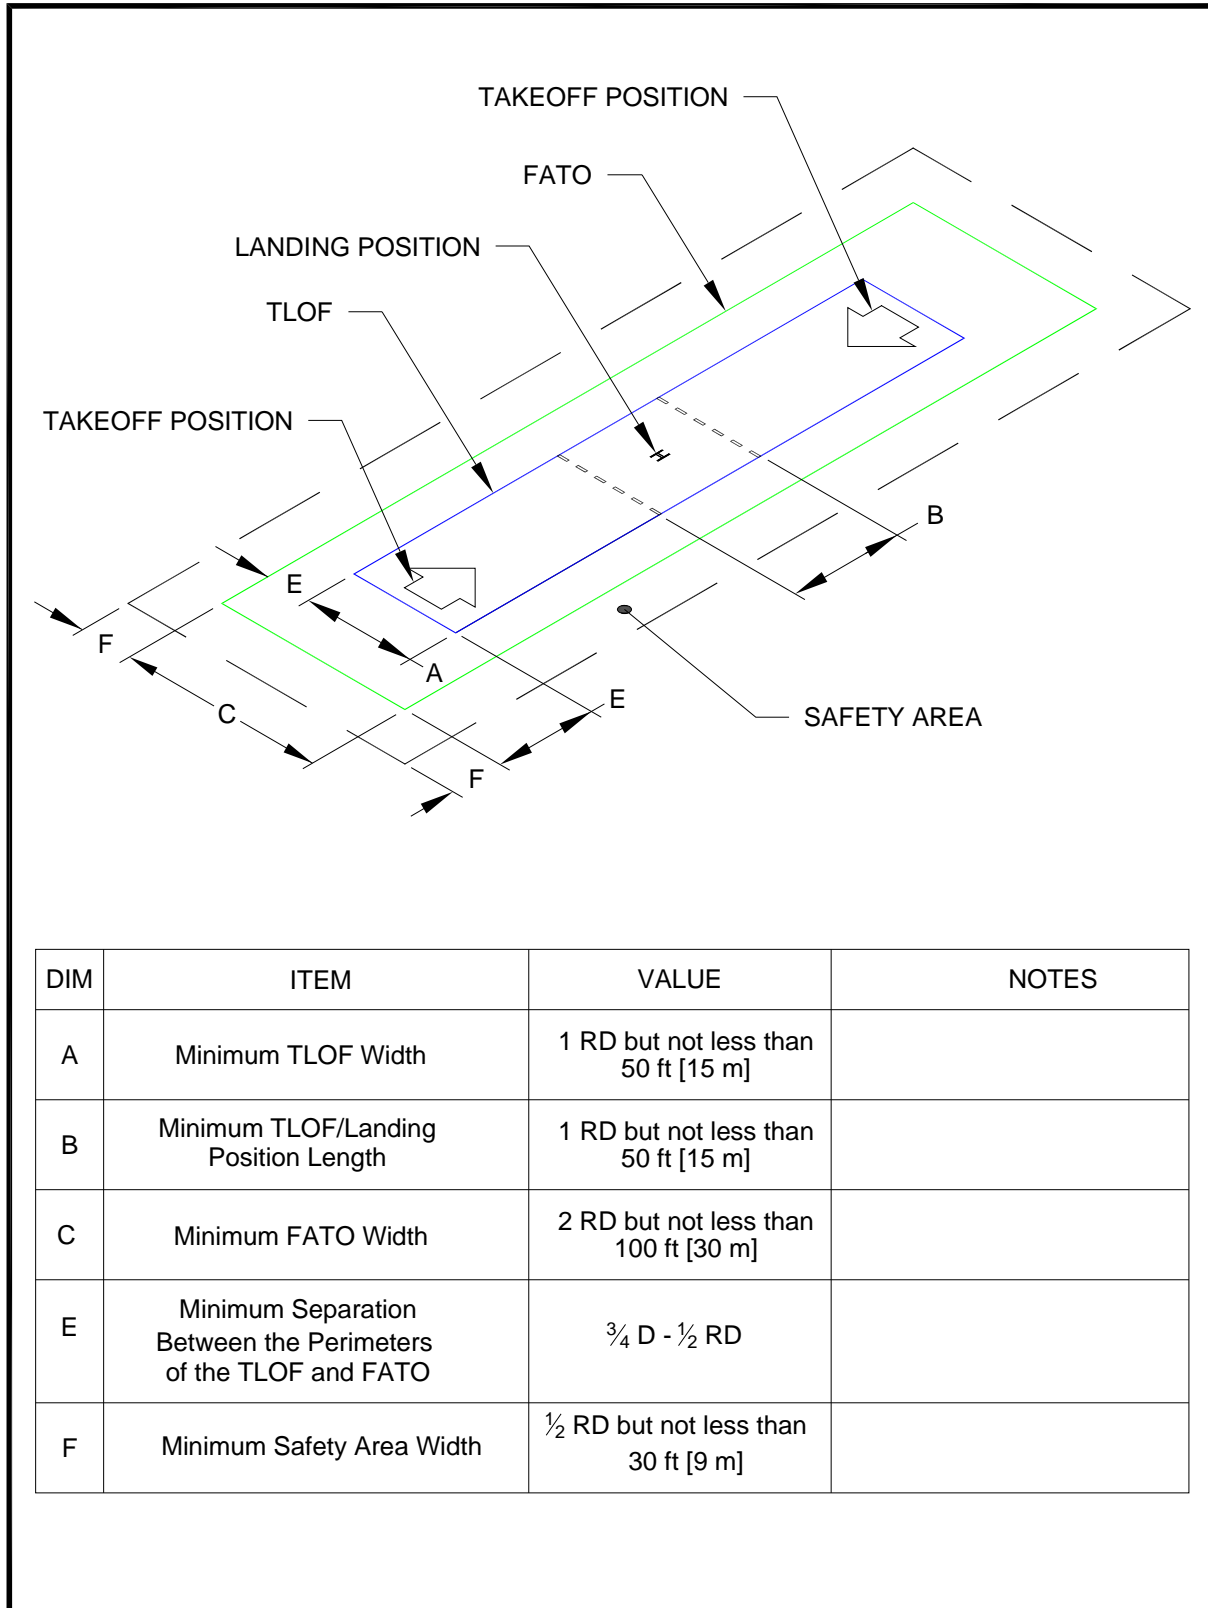

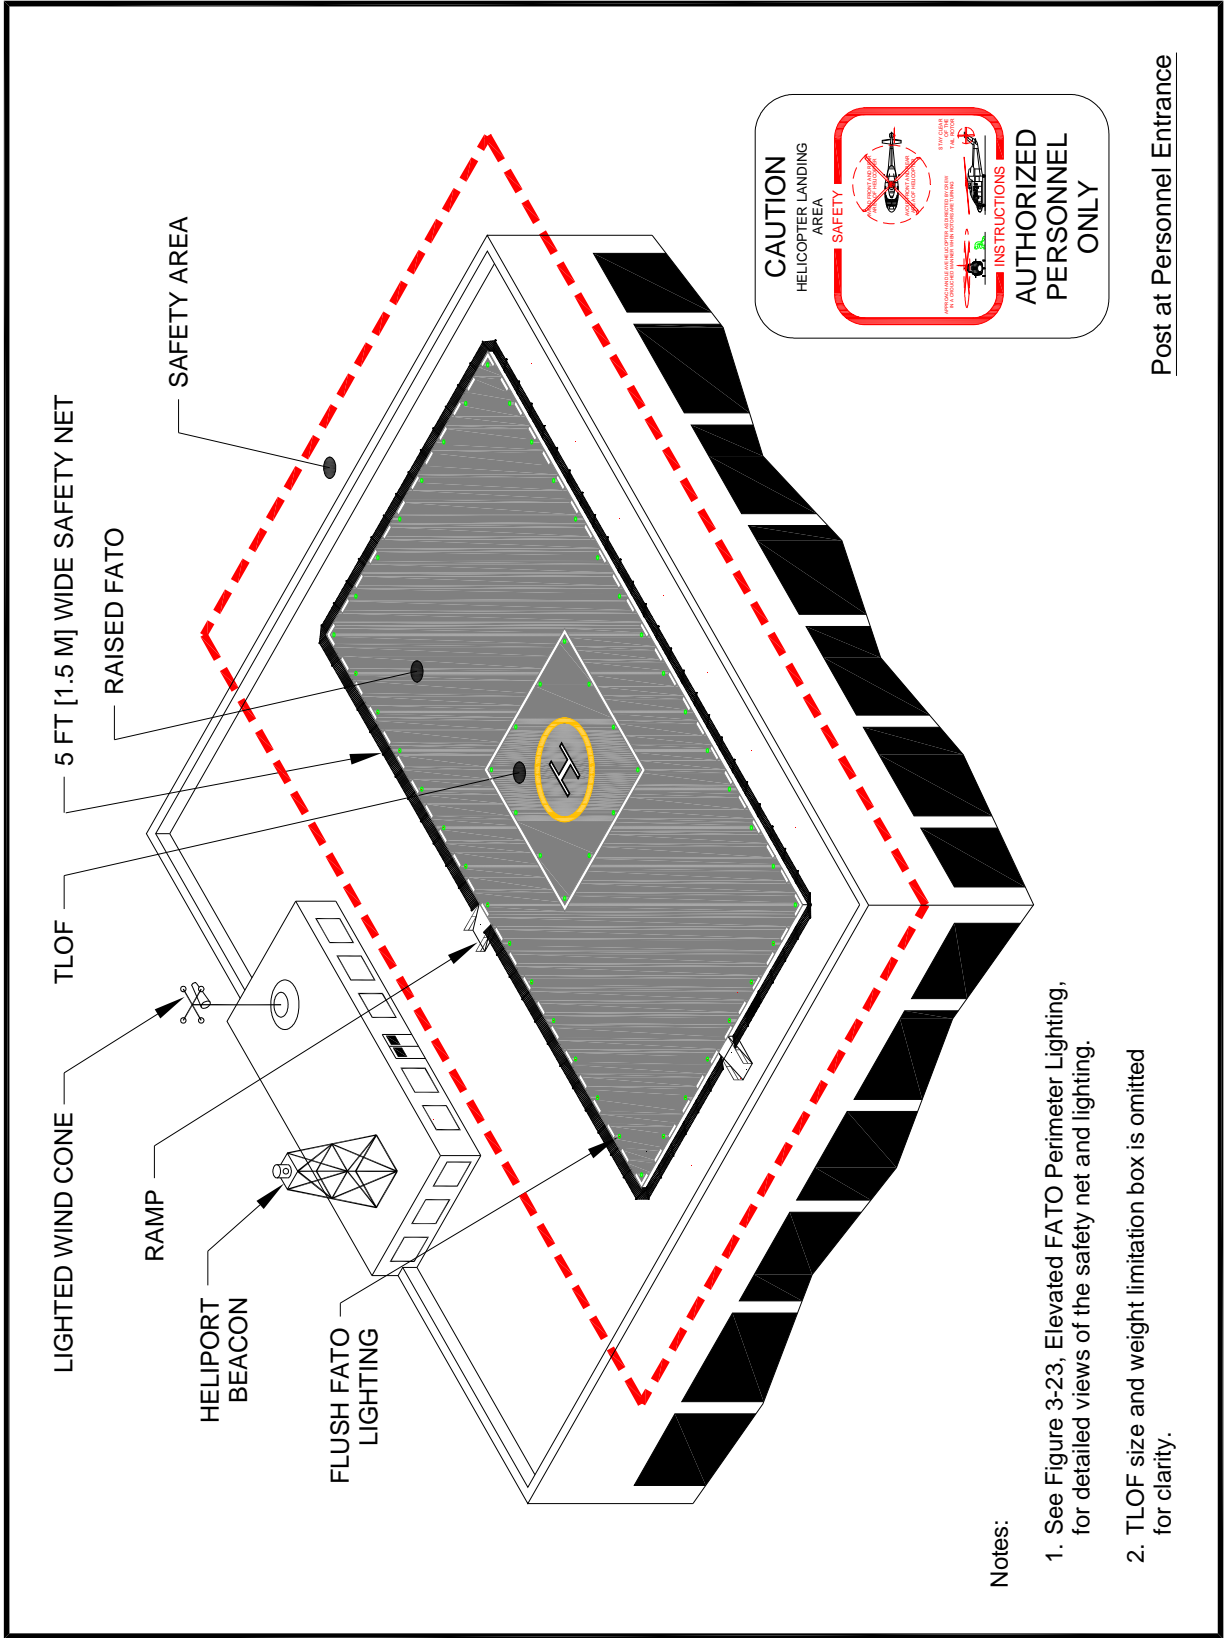

Figure 3-3. Elongated FATO with Two Takeoff Positions: Transport

Notes:

- 1. See Figure 3-23, Elevated FATO Perimeter Lighting, for detailed views of the safety net and lighting.
- 2. TLOF size and weight limitation box is omitted for clarity.

Post at Personnel Entrance

Figure 3-4. Elevated Heliport: Transport

307. Final approach and takeoff area (FATO). A transport heliport has at least one FATO. The FATO contains a TLOF within its borders at which arriving helicopters terminate their approach, and from which departing helicopters take off.

a. FATO size. The FATO is a rectangular surface with the long axis aligned with the preferred flight path. See Figure 3–2.

(1) FATO width. The minimum width of a FATO is at least 2.0 times the RD of the design helicopter but not less than 100 feet (30.5 m).

(2) FATO length. The minimum length of the FATO is 2.0 times the RD of the design helicopter but not less than 200 feet (61 m). At elevations above 1000 feet MSL, a longer FATO is required to provide an increased safety margin and greater operational flexibility. Use the additional FATO length depicted in Figure 3–5.

Figure 3–5. Additional FATO Length for Heliports at Higher Elevations: Transport

(3) Design the minimum distance between the TLOF perimeter and the FATO perimeter to be not less than $\frac{3}{4} D - \frac{1}{2} RD$, where D and RD are of the design helicopter.

b. FATO surface characteristics.

(1) Design the entire FATO to support the dynamic loads of the design helicopter.

(2) If the FATO surface is unpaved, treat it to prevent loose stones and any other flying debris caused by rotor wash.

(3) Design the portion of the FATO abutting the TLOF to be contiguous with the TLOF, with the adjoining edges at the same elevation.

c. Rooftop and other elevated FATOs.

(1) **Design loads.** Design elevated FATOs and any FATO supporting structure to be capable of supporting the dynamic loads of the design helicopter

(2) **Elevation.** Elevate the FATO above the level of any object in the safety area that cannot be removed.

(3) **Obstructions.** Elevator penthouses, cooling towers, exhaust vents, fresh air vents, and other raised features can affect heliport operations. Establish control mechanisms to ensure obstruction hazards are not installed after the heliport is operational.

(4) **Air quality.** Helicopter exhaust can affect building air quality if the heliport is too close to fresh air vents. When designing a building intended to support a helipad, locate fresh air vents accordingly. When adding a helipad to an existing building, relocate fresh air vents if necessary or, if relocation is not practical, installing charcoal filters or a fresh air intake bypass louver system for HVAC systems may be adequate.

(5) **FATO surface characteristics.** Construct rooftop and other elevated heliport FATOs of metal, concrete, or other materials subject to local building codes. Provide the FATO surface with non-slippery footing for people.

(6) **Safety net.** If the platform is elevated 4 feet (1.2 m) or more above its surroundings, Title 29 CFR Part 1910.23, Guarding Floor and Wall Openings and Holes, requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences since they would be safety hazards during helicopter operations. As an option, install a safety net, meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load-carrying capability of 50 lb/sq ft (244 kg/sq m). Do not allow the net, as illustrated in Figure 3–23, to project above the level of the FATO. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

(7) **Access to elevated FATOs.** Title 29 CFR Part 1926.34, Means of Egress, requires two separate access points for an elevated structure such as one supporting an elevated FATO. Design stairs in compliance with Title 29 CFR Part 1910.24, Fixed Industrial Stairs. Design handrails required by this standard to fold down or be removable to below the level of the FATO so they will not be hazards during helicopter operations.

d. Mobile objects within the FATO. The FATO design standards in this AC assume the TLOF and FATO are closed to other aircraft if a helicopter or other mobile object is within the FATO or the safety area.

e. Fixed objects within the FATO. Remove all fixed objects projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

f. FATO/FATO separation. If a heliport has more than one FATO, separate the perimeters of two FATOs so the respective safety areas do not overlap. This separation assumes simultaneous approach/departure operations will not take place. If the heliport operator intends for the facility to support simultaneous operations, provide a minimum 200 foot (61 m) separation.

g. FATO gradients. Recommended FATO gradients are defined in Chapter 7.

308. Safety area. The safety area surrounds the FATO.

a. Safety area width. The safety area extends outward on all sides of the FATO for a distance of at least $\frac{1}{2}$ RD but not less than 30 feet (9 m).

b. Mobile objects within the safety area. The safety area design standards of this AC assume the TLOF and FATO are closed to other aircraft if a helicopter or other mobile object is within the FATO or the safety area.

c. Fixed objects within a safety area. Remove all fixed objects within a safety area projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

d. Safety area surface. The safety area need not be load bearing. Figure 3–6 depicts a safety area extending over water. If possible, make the portion of the safety area abutting the FATO contiguous with the FATO with the adjoining edges at the same elevation. This is needed to avoid the risk of catching a helicopter skid or wheel. Clear the safety area of flammable materials and treat the area to prevent loose stones and any other flying debris caused by rotor wash.

e. Safety area gradients. Safety area gradients are detailed in Chapter 7.

309. VFR approach/departure paths. The purpose of approach/departure airspace, shown in Figure 3–7 and Figure 3–8, is to provide sufficient airspace clear of hazards to allow safe approaches to and departures from the TLOF.

a. Number of approach/departure paths. Align preferred approach/departure paths with the predominant wind direction so downwind operations are avoided and crosswind operations are kept to a minimum. To accomplish this, design a transport heliport to have more than one approach/departure path. Base other approach/departure paths on the assessment of the prevailing winds or, when this information is not available, separate such flight paths and the preferred flight path by at least 135 degrees. See Figure 3–7.

b. VFR Approach/Departure and Transitional Surfaces. Figure 3–7 and Figure 3–8 illustrate the approach/departure and transitional surfaces.

(1) An approach/departure surface is centered on each approach/departure path. The approach /departure path starts at the edge of the FATO and slopes upward at 8:1 (8 units horizontal in 1 unit vertical) for a distance of 4,000 feet (1,219 m) where the width is 500 feet (152 m) at a height of 500 feet (152 m) above the heliport elevation.

(2) The transitional surfaces start from the edges of the FATO parallel to the flight path center line, and from the outer edges of approach/departure surface, and extend outwards at a slope of 2:1 (2 units horizontal in 1 units vertical) for a distance of 250 feet (76 m) from the centerline. The transitional surfaces start at the edge of the FATO parallel to the approach/departure surfaces and extend to the end of the approach/departure surface. The transitional surface does not apply on the FATO edge opposite the approach/departure surface.

Figure 3-6. Non-load-bearing Safety Area: Transport

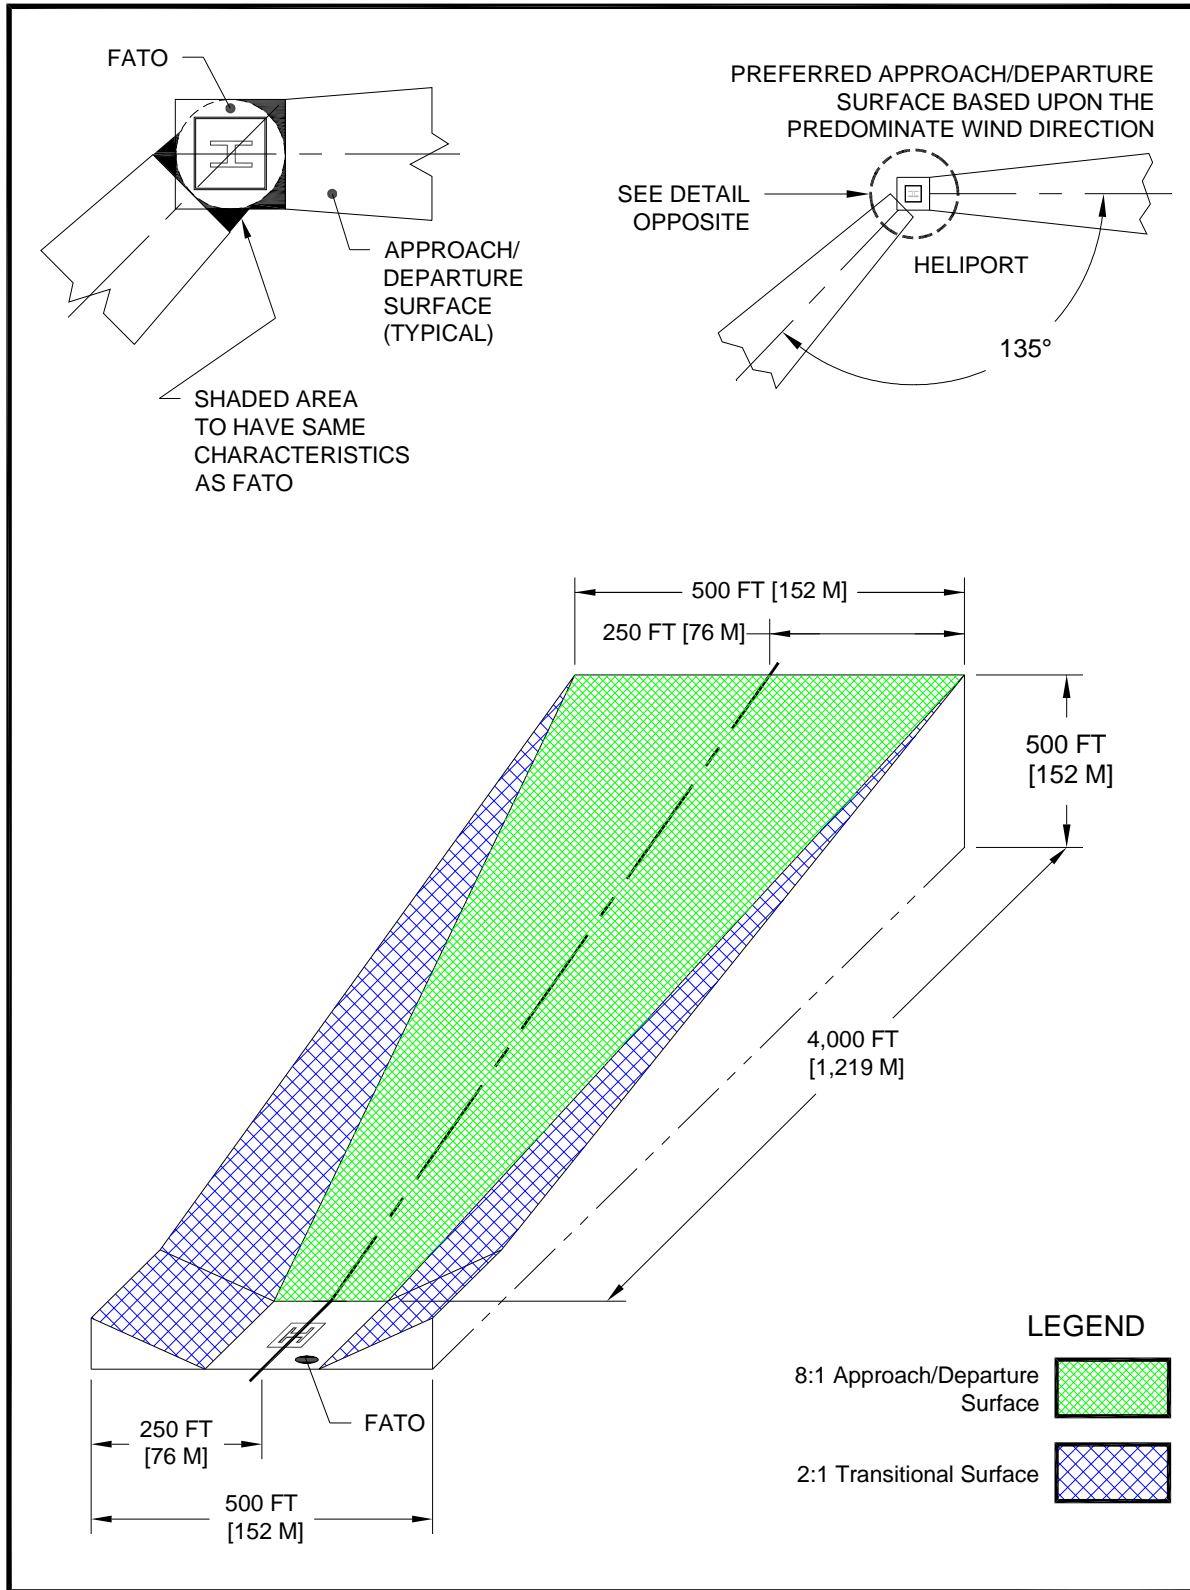

Figure 3-7. VFR Heliport Approach/Departure and Transitional Surfaces: Transport

(3) Make sure the approach/departure and transitional surfaces are free of penetrations unless an FAA aeronautical study determines such penetrations not to be hazards. The FAA conducts such aeronautical studies only at public heliports and private airports with FAA-approved approach procedures. Paragraph 111 provides additional information on hazards to air navigation.

c. Curved VFR approach/departure paths. As an option, include one curve in VFR approach/departure paths. As an option, design these paths to use the airspace above public lands, such as freeways or rivers. When including a curved portion in the approach/departure path, make sure the sum of the radius of arc defining the center line and the length of the straight portion originating at the FATO is not less than 1,886 feet (575 m). Design the approach/departure path so the minimum radius of the curve is 886 feet (270 m) and that the curve follows a 1,000 feet (305 m) straight section. Design the approach/departure path so the combined length of the center line of the curved portion and the straight portion is 4,000 feet (1,219 m). See Figure 3–8.

d. Flight path alignment guidance. As an option, use flight path alignment markings and/or flight path alignment lights (see paragraphs 301.d and 301.g) where it is desirable and practicable to indicate available approach and/or departure flight path direction(s). See Figure 3–9.

e. Periodic review of obstructions. Vigilant heliport operators reexamine obstacles in the vicinity of approach/departure paths on at least an annual basis. This reexamination includes an appraisal of the growth of trees near approach and departure paths. Paragraph 111 provides additional information on hazards to air navigation. Pay particular attention to obstacles that need to be marked or lighted. It may be helpful to maintain a list of the GPS coordinates and the peak elevation of obstacles.

310. Heliport protection zone (HPZ). The FAA recommends the establishment of an HPZ for each approach/departure surface. The HPZ is the area under the approach/departure surface starting at the FATO perimeter and extending out for a distance of 400 feet (122 m), as illustrated in Figure 3–10. The HPZ is intended to enhance the protection of people and property on the ground. This is achieved through heliport owner control over the HPZ. Such control includes clearing HPZ areas (and maintaining them clear) of incompatible objects and activities. The FAA discourages residences and places of public assembly in an HPZ. (Churches, schools, hospitals, office buildings, shopping centers, and other uses with similar concentrations of persons typify places of public assembly.) Do not locate hazardous materials, including fuel, in the HPZ.

311. Wind cone.

a. Specification. Use a wind cone conforming to AC 150/5345-27, Specification for Wind Cone Assemblies, to show the direction and magnitude of the wind. Use a color that provides the best possible color contrast to its background.

b. Wind cone location. Locate the wind cone so it provides the pilot with valid wind direction and speed information in the vicinity of the heliport under all wind conditions.

(1) At many landing sites, there may be no single, ideal location for the wind cone. At other sites, it may not be possible to site a wind cone at the ideal location. In such cases, install more than one wind cone in order to provide the pilot with all the wind information needed for safe operations.

(2) Place the wind cone so a pilot on the approach path can see it clearly when the helicopter is 500 feet (150 m) from the TLOF.

(3) Place the wind cone so pilots can see it from the TLOF.

(4) To avoid presenting an obstruction hazard, locate the wind cone(s) outside the safety area, and so it does not penetrate the approach/departure or transitional surfaces.

c. Wind cone lighting. For night operations, illuminate the wind cone, either internally or externally, to ensure it is clearly visible.

312. Taxiways and taxi routes. Taxiways and taxi routes provide for the movement of helicopters from one part of a landing facility to another. They provide a connecting path between the FATO and a parking area. They also provide a maneuvering aisle within the parking area. A taxi route includes the taxiway plus the appropriate clearances needed on both sides. The relationship between a taxiway and a taxi route is illustrated in Figure 3–11.

a. Taxiway/taxi route widths. The dimensions of taxiways and taxi routes are a function of helicopter size and type of taxi operations (ground taxi or hover taxi). Find these dimensions in Table 3-1. Normally, the requirement for hover taxi dictates the taxiway/taxi route widths. However, when the fleet comprises a combination of large ground taxiing helicopters and smaller air taxiing helicopters, the larger aircraft may dictate the taxiway/taxi route widths. If wheel-equipped helicopters taxi with wheels not touching the surface, design the facility with hover taxiway widths rather than ground taxiway widths. Where the visibility of the centerline marking cannot be guaranteed at all times, such as locations where snow or dust commonly obscure the centerline marking and it is not practical to remove it, determine the minimum taxiway/taxi route dimensions as if there was no centerline marking.

b. Surfaces. For ground taxiways, provide a portland cement concrete or asphalt surface. For unpaved portions of taxi routes, provide a turf cover or treat the ground in some way to prevent dirt and debris from being raised by a taxiing helicopter’s rotor wash.

c. Gradients. See Chapter 7 for taxiway and taxi route gradient standards.

313. Helicopter parking. A transport heliport has a paved apron for parking helicopters. The size of the apron depends on the number and size of specific helicopters to be accommodated. It is not necessary that every parking position accommodate the design helicopter. Design individual parking positions to accommodate the helicopter size and weight expected to use the parking position at the facility. However, use the design helicopter to determine the separation between parking positions and taxi routes. Use the larger helicopter to determine the separation between parking positions intended for helicopters of different sizes. Design parking positions to support the static loads of the helicopter intended to use the parking area. Ground taxi turns of wheeled helicopters are significantly larger than a hover turn. Consider the turn radius of helicopters when designing taxi intersections and parking positions for wheeled helicopters. Design heliport parking areas so helicopters will be parked in an orientation that keeps the “avoid areas” around the tail rotors (see Figure 3–12) clear of passenger walkways. Establish separate aprons for specific functions such as passenger boarding, maintenance, and parking of based and transient helicopters.

Table 3-1. Taxiway and Taxi Route Dimensions – Transport Heliports

Taxiway (TW)	Centerline Marking Type	TW Edge Marking Type	Minimum Width of Paved Area	Lateral Separation Between TW Edge Markings	Total Taxi Route Width
Ground Taxiway	Painted	Painted	2 x UC	2 x UC	1½ RD
Hover Taxi	Painted	Painted	2 x UC	2 x UC	2 RD
RD: rotor diameter of the design helicopter TW: taxiway UC: undercarriage length or width (whichever is larger) of the design helicopter					

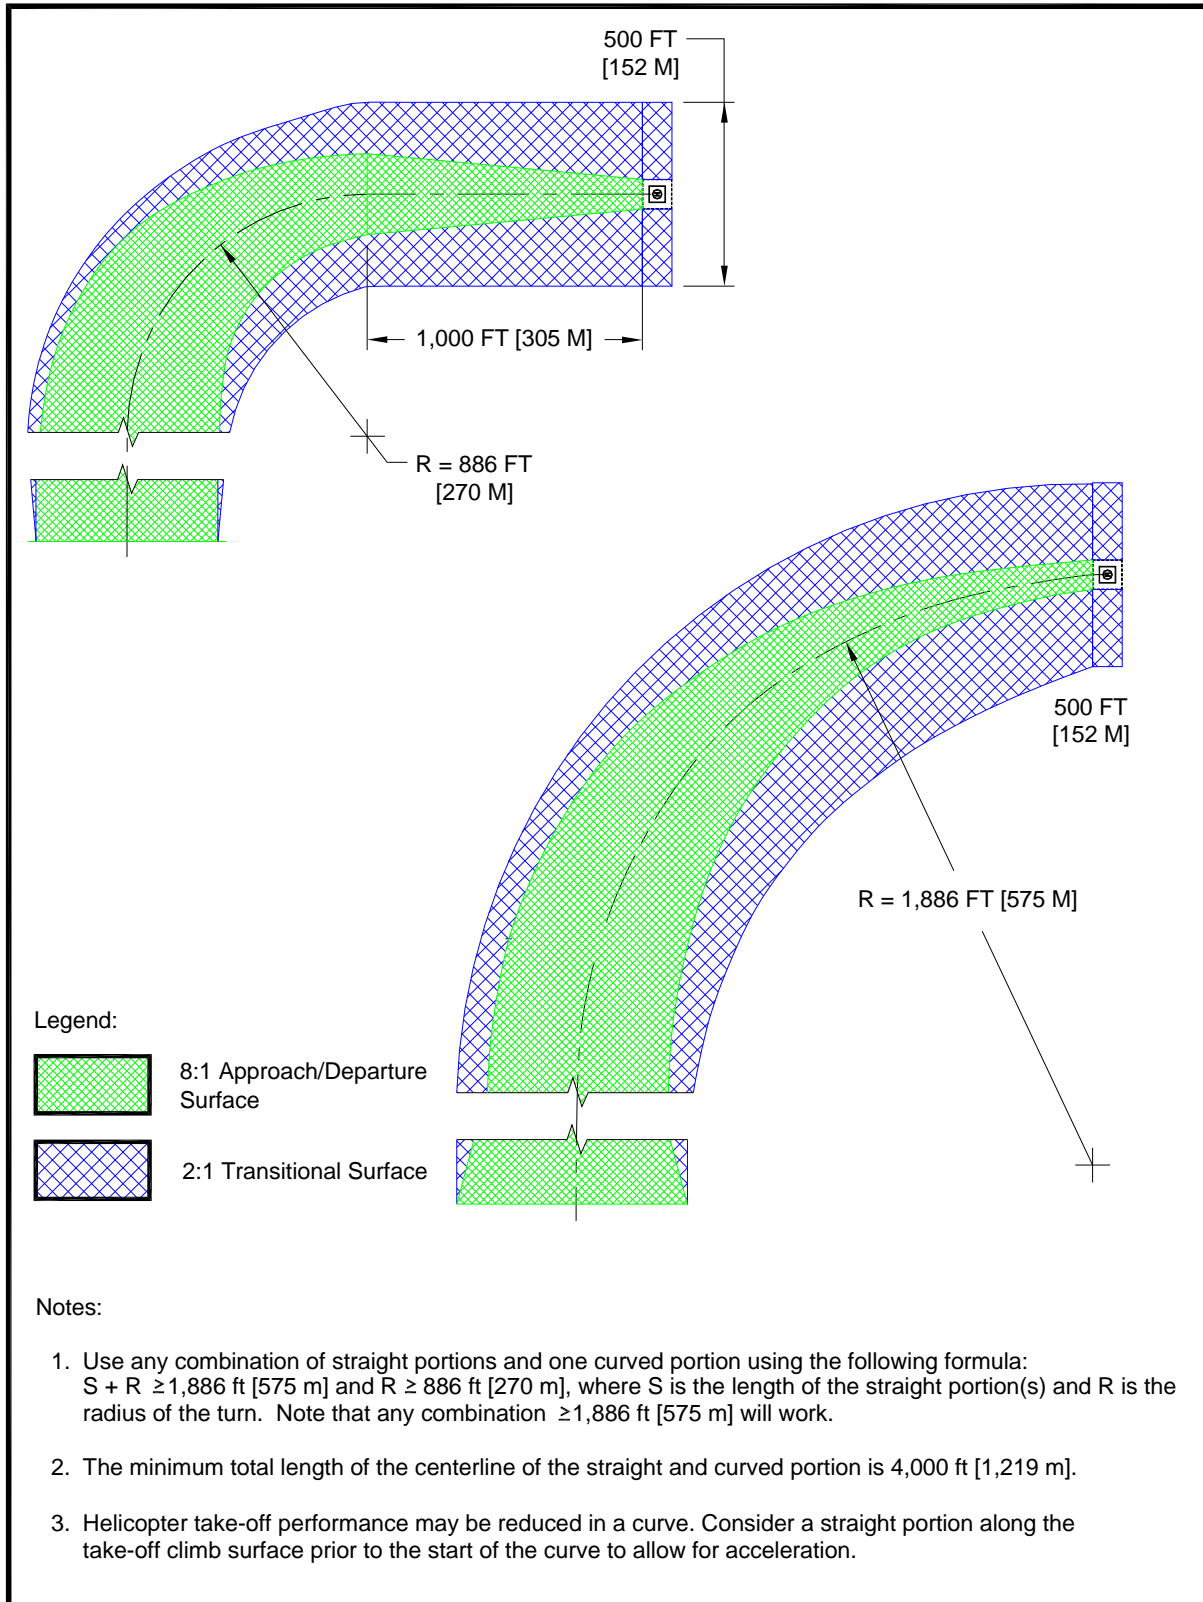

Figure 3–8. Curved Approach/Departure: Transport

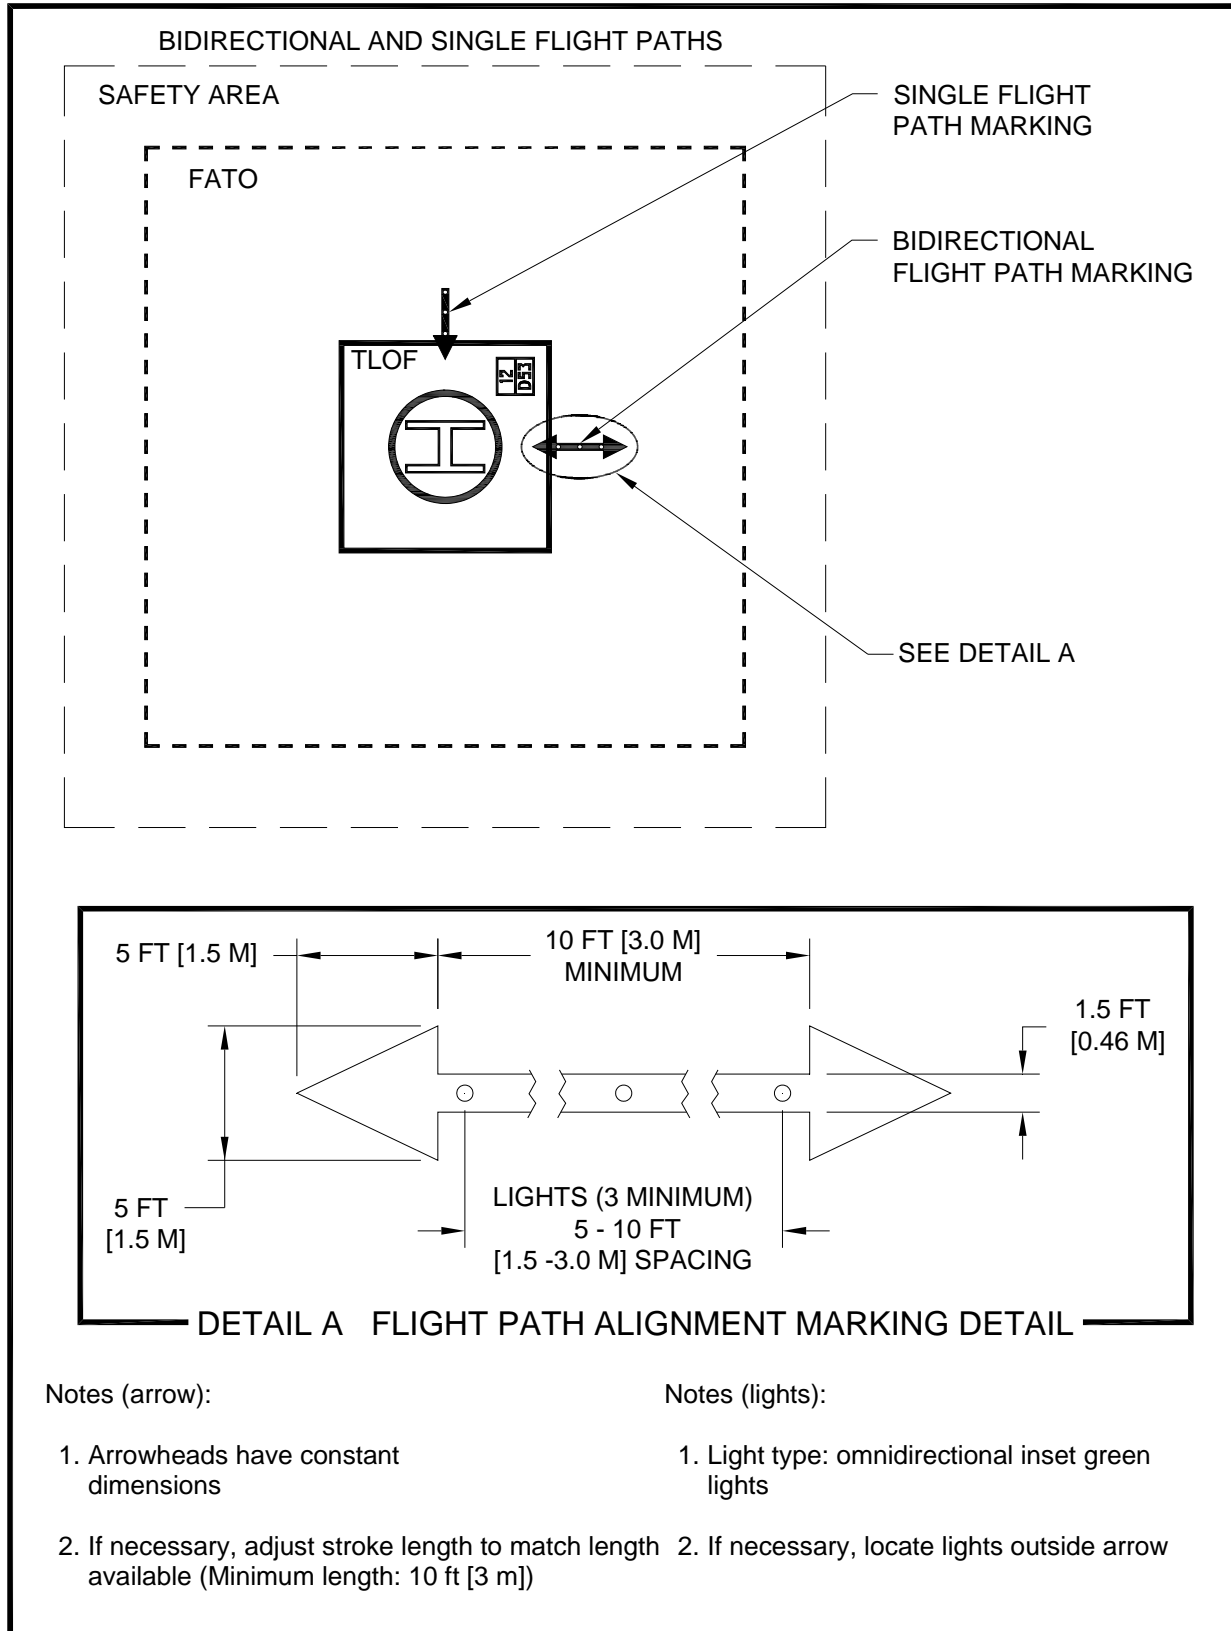

Figure 3-9. Flight Path Alignment Marking and Lights: Transport

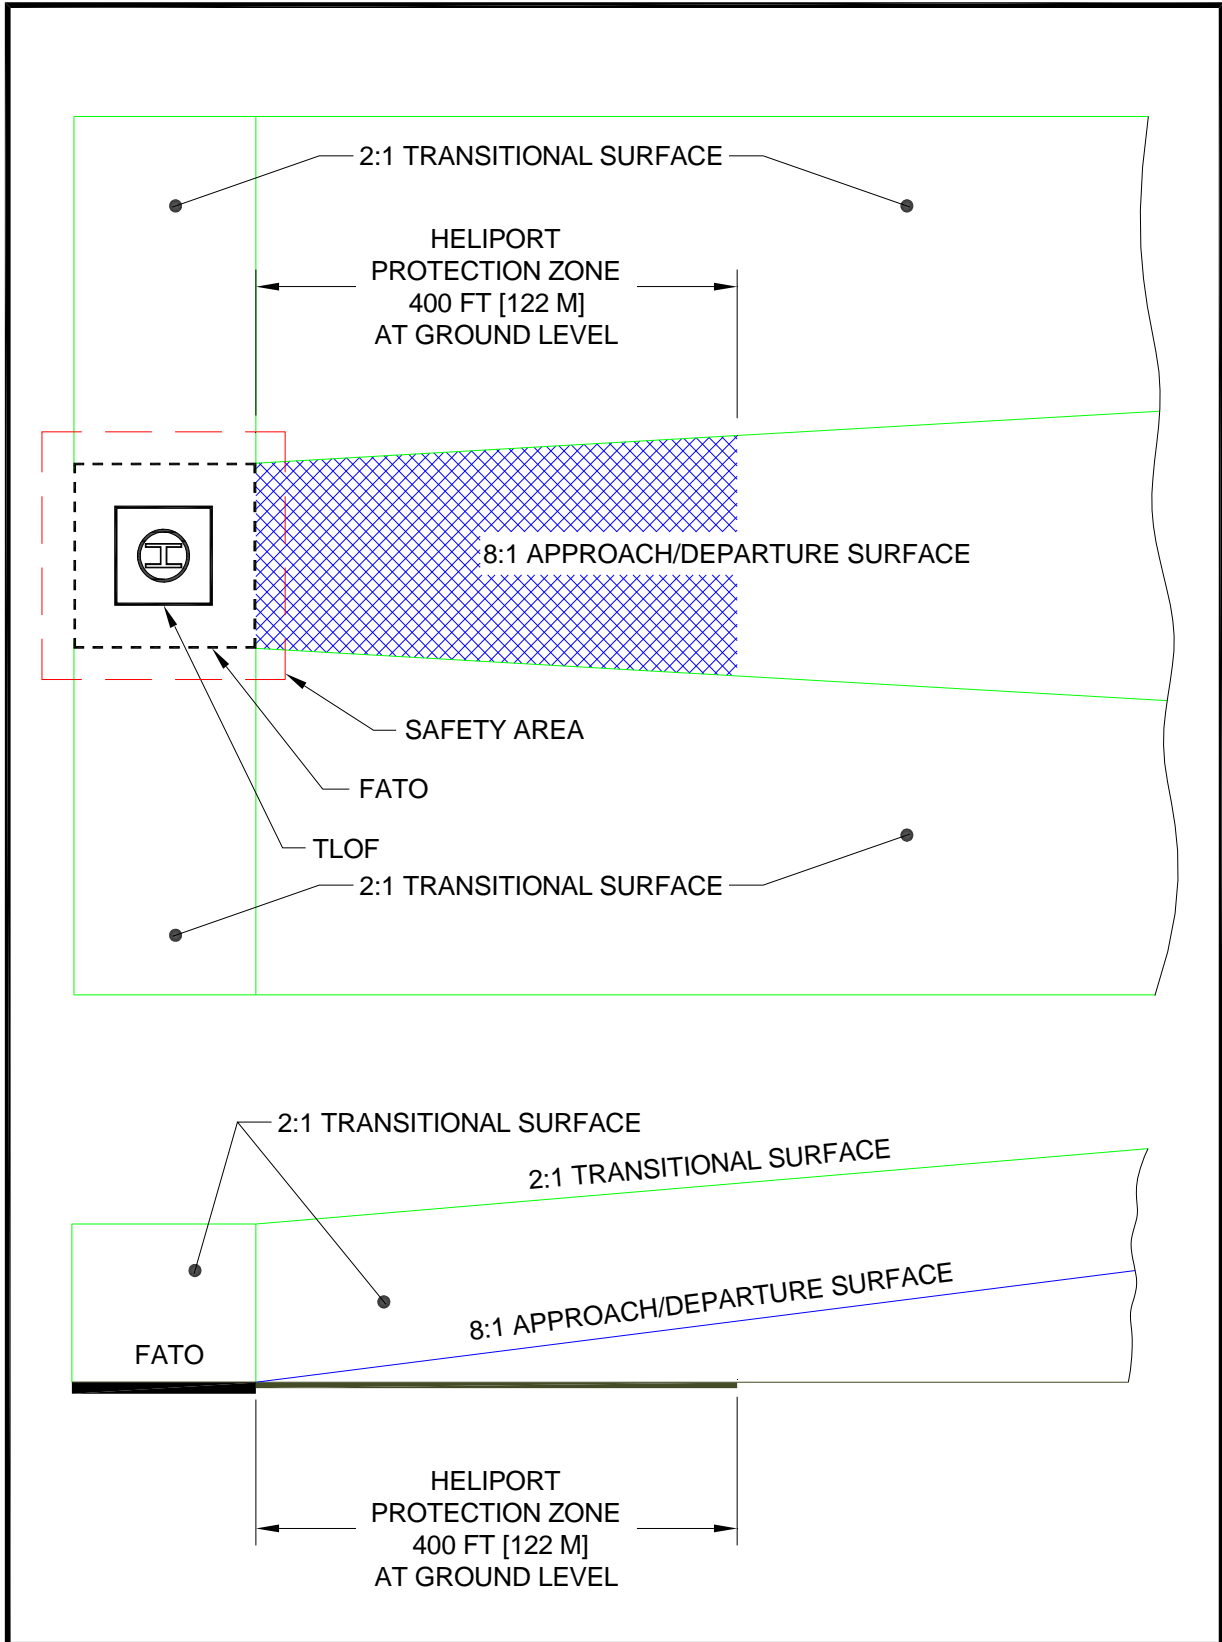

Figure 3-10. Heliport Protection Zone: Transport

**Figure 3–11. Taxiway/Taxi Route Relationship,
Centerline and Edge Marking: Transport**

Figure 3-12. "Turn-around" Helicopter Parking Position Marking: Transport

Figure 3-13. "Taxi-through" Helicopter Parking Position Marking: Transport

a. Location. Do not locate aircraft parking areas under an approach/departure surface. As an option, allow aircraft parking areas under the transitional surfaces.

(1) For “turn around” parking positions, locate the parking position to provide a minimum distance between the tail rotor arc and any object, building, or safety area. The standard for this distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or $\frac{1}{3}$ RD for hover taxi operations. See Figure 3–12 and Figure 3–14.

(2) For “taxi-through” parking positions, locate the parking position to provide a minimum distance between the main rotor circle and any object, building, or safety area. The standard for this distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or $\frac{1}{3}$ RD for hover taxi operations. See Figure 3–13 and Figure 3–15.

(3) Locate the parking position to provide a minimum distance between the tail rotor arc and the edge of any taxi route. The standard for this distance is $\frac{1}{2}$ RD but not less than 30 feet (9.1 m).

b. Size. Parking position sizes are dependent upon the helicopter size. The clearances between parking positions are dependent upon the type of taxi operations (ground-taxi or hover/ taxi) and the intended paths for maneuvering in and out of the parking position. The more demanding operation will dictate what is needed at a particular site. Usually, the parking area needs for skid-equipped helicopters will be the most demanding. However, when the largest helicopter is a very large, wheeled aircraft (for example, the S-61), and the skid-equipped helicopters are all much smaller, the parking size needs for wheeled helicopters may be the most demanding. If wheel-equipped helicopters taxi with wheels not touching the surface, design parking areas based on hover taxi operations rather than ground taxi operations.

(1) If all parking positions are the same size, design them to be large enough to accommodate the largest helicopter that will operate at the heliport.

(2) As an option when there is more than one parking position, design the facility with parking positions of various sizes with at least one position that will accommodate the largest helicopter that will park at the heliport. Design other parking positions to be smaller, for the size of the individual or range of individual helicopters parking at that position.

(3) “Turn-around” parking positions are illustrated in Figure 3–14.

(4) “Taxi-through” parking positions are illustrated in Figure 3–15. When using this design for parking positions, the heliport owner and operator take steps to ensure all pilots are informed that “turn-around” departures from the parking position are not permitted.

(5) Do not design “back-out” parking positions at transport heliports.

c. Passenger walkways. Provide marked walkways at parking positions. Locate passenger walkways to minimize passenger exposure to various risks during passenger loading and unloading. Design the pavement so spilled fuel does not drain onto passenger walkways or toward parked helicopters.

d. Fueling. Design the facility to allow fueling with the use of a fuel truck or a specific fueling area with stationary fuel tanks.

Figure 3-14. Parking Area Design – “Turn-around” Parking Positions: Transport

Figure 3-15. Parking Area Design – “Taxi-through” Parking Position

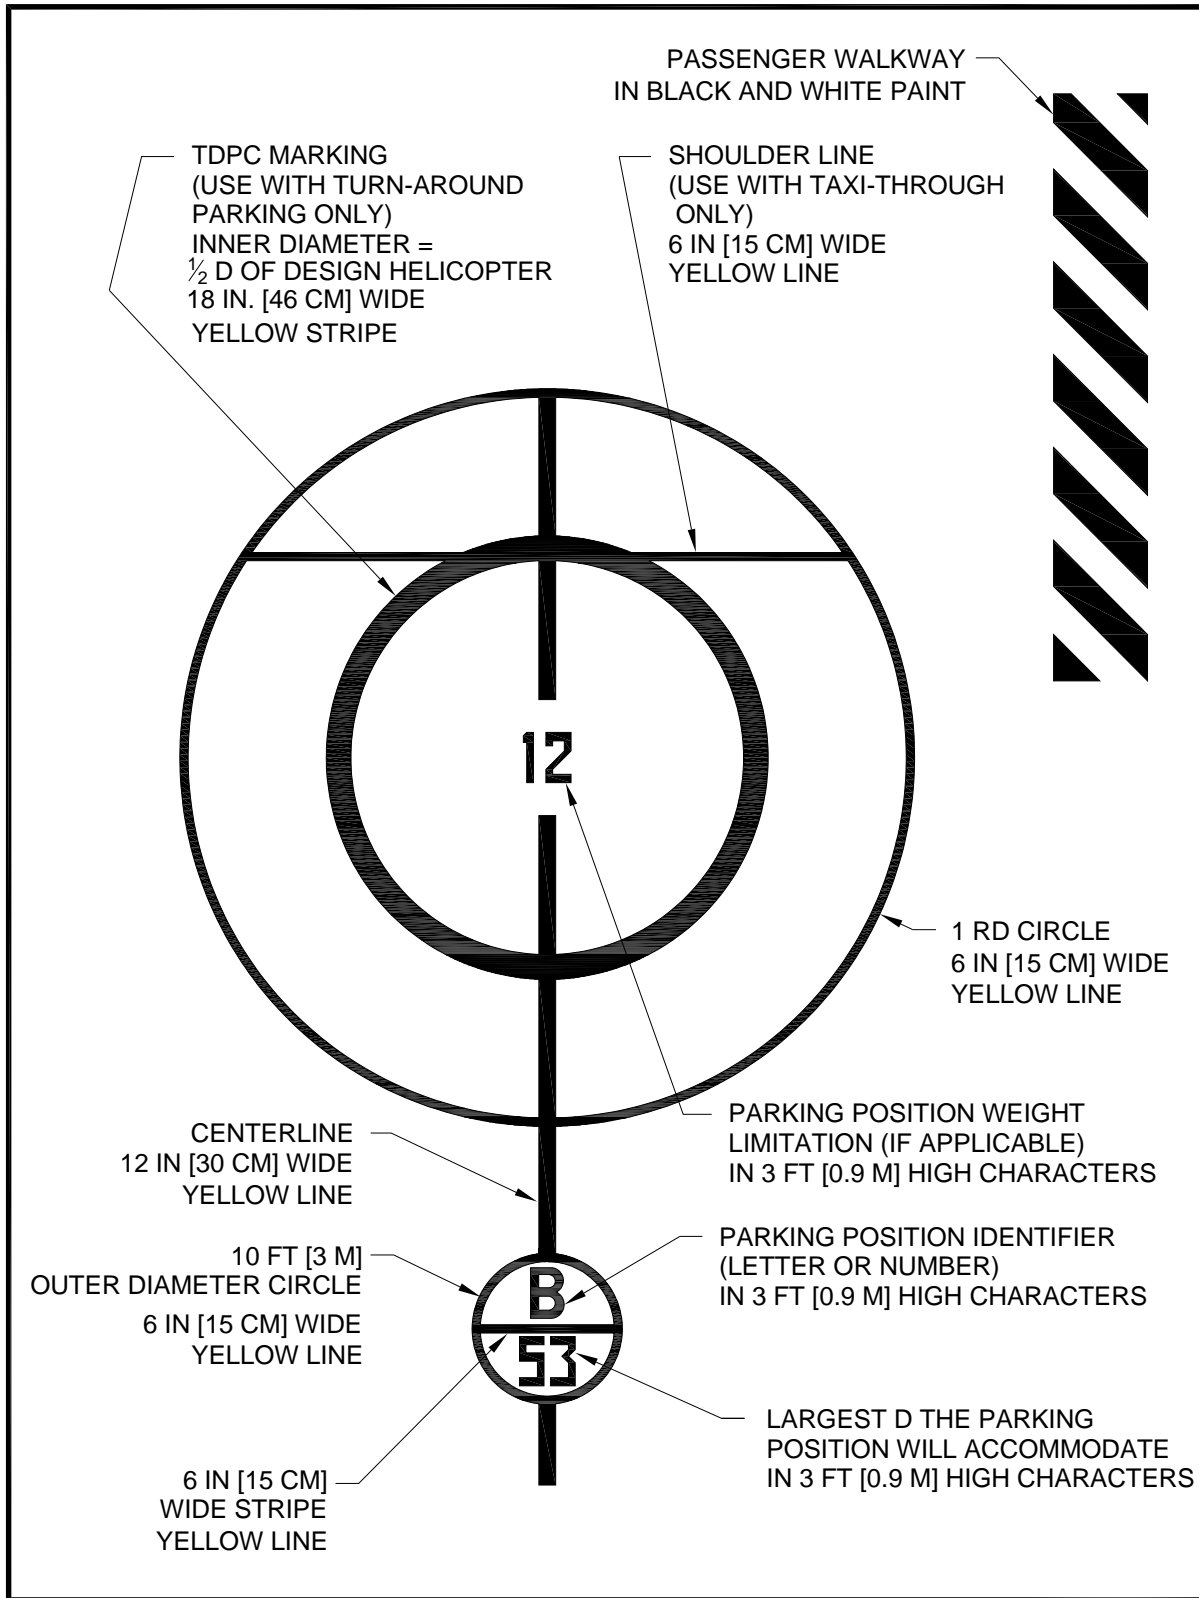

Figure 3-16. Parking Position Identification, Size and Weight Limitations: Transport

(1) Various federal, state, and local requirements for petroleum handling facilities apply to systems for storing and dispensing fuel. Find guidance in AC 150/5230-4, Aircraft Fuel Storage, Handling, and Dispensing on Airports. Find additional information in various National Fire Protection Association (NFPA) publications. For a list of more resources, see Appendix D.

(2) Do not locate fueling equipment in the TLOF, FATO, or safety area. Design separate fueling locations and mark them to minimize the potential for helicopters to collide with the dispensing equipment. Design fueling areas so there is no object tall enough to be hit by the main or tail rotor blades within a distance of RD of the design helicopter from the center point of the position where the helicopter is fueled (providing $\frac{1}{2}$ RD clearance from the rotor tips). If this is not practical at an existing facility, install long fuel hoses.

(3) Lighting. Light the fueling area if night fueling operations are contemplated. Ensure any light poles do not constitute an obstruction hazard.

e. Tiedowns. Install recessed tiedowns to accommodate extended or overnight parking of based or transient helicopters. Ensure any depression associated with the tiedowns is of a diameter not greater than one-half the width of the smallest helicopter landing wheel or landing skid anticipated to be operated on the heliport surface. In addition, provide storage for tiedown chocks, chains, cables, and ropes off the heliport surface to avoid fouling landing gear. Find guidance on tiedowns in AC 20-35, Tiedown Sense.

314. Heliport markers and markings. Markers and/or surface markings identify the facility as a heliport. Use surface markings of paint or preformed material. (See AC 150/5370-10, Item P-620, for specifications for paint and preformed material). As an option, use reflective paint and reflective markers, though remember overuse of reflective material can be blinding to a pilot using landing lights. As an option, outline lines/markings with a 6-inch (15 cm) wide line of a contrasting color to enhance conspicuity. Place markings that define the edges of a TLOF, FATO, taxiway or apron within the limits of those areas. Use the following markers and markings.

a. Heliport identification marking. The identification marking identifies the location as a heliport, marks the TLOF and provides visual cues to the pilot. The marking consists of a white "H." The "H" has a minimum height of 0.3 D. Locate the "H" in the center of the TLOF and orient it on the axis of the preferred approach/departure path. Place a one-foot wide bar under the "H" when it is necessary to distinguish the preferred approach/departure direction. The proportions and layout of the letter "H" are illustrated in Figure 3-17.

b. TLOF markings.

(1) **TLOF perimeter marking.** Define the perimeter of a TLOF with a continuous 12-inch (30 cm) wide, white line, as shown in Figure 3-18.

(2) **Touchdown/positioning circle (TDPC) marking.** A TDPC marking provides guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot's seat is over the marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2}$ D and a line width of 18 in (46 cm). Locate a TDPC marking in the center of a TLOF. See Figure 3-17.

Figure 3-17. Standard Helipoint Identification Symbol, TLOF Size and Weight Limitations: Transport

**Figure 3–18. Paved TLOF/Paved FATO –
Paved TLOF/Unpaved FATO – Marking: Transport**

(3) TLOF size and weight limitations. Mark the TLOF to indicate the length and weight of the largest helicopter it will accommodate, as shown in Figure 3–17. Place these markings in a box in the lower right-hand corner of the TLOF, or the on right-hand side of the “H” of a circular TLOF, when viewed from the preferred approach direction. The box is 10 feet square (3 m). The numbers are 36” (92 cm) high (see Figure C–2). The numbers are black with a white background.

(4) TLOF size limitation. This number is the length (D) of the largest helicopter the TLOF will accommodate, as shown in Figure 3–17. The marking consists of the letter “D” followed by the dimension in feet. Do not use metric equivalents for this purpose. Center this marking in the lower section of the TLOF size/weight limitation box.

(5) TLOF weight limitations. If a TLOF has limited weight-carrying capability, mark it with the maximum takeoff weight of the design helicopter, in units of thousands of pounds, as shown in Figure 3–17. Do not use metric equivalents for this purpose. Center this marking in the upper section of a TLOF size/weight limitation box. If the TLOF does not have a weight limit, add a diagonal line, extending from the lower left hand corner to the upper right hand corner, to the upper section of the TLOF size/weight limitation box.

c. FATO markings.

(1) FATO perimeter marking.

(a) Paved FATOs. Define the perimeter of a paved FATO with a 12-inch (30 cm) wide dashed white line. Define the corners of the FATO. The marking segments are approximately 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m). See Figure 3–18.

(b) Unpaved FATOs. Mark the perimeter of an unpaved FATO with 12-inch (30 cm) wide, flush in-ground markers. Define the corners of the FATO. They are approximately 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m). See Figure 3–18.

d. Flight path alignment guidance marking. An optional flight path alignment guidance marking consists of one or more arrows to indicate the preferred approach/departure direction(s). Place it on the TLOF, FATO and/or safety area surface as shown in Figure 3–9. The shaft of the arrow is 18 inches (50 cm) in width and at least 10 feet (3 m) in length. When combined with a flight path alignment guidance lighting system described in paragraph 301.g, it takes the form shown in Figure 3–9, which includes scheme for marking the arrowheads. Use a color that provides good contrast against the background color of the surface. An arrow pointing toward the center of the TLOF depicts an approach direction. An arrow pointing away from the center of the TLOF depicts a departure direction. In the case of a flight path limited to a single departure path, the arrow marking is unidirectional. In the case of a heliport with only a bidirectional approach /takeoff flight path available, the arrow marking is bidirectional.

e. Taxiway and taxi route markings.

(1) Taxiway markings. Mark the centerline of a taxiway with a continuous 6-inch (15 cm) yellow line. Mark both edges of the taxiway with two continuous 6-inch (15 cm) wide yellow lines spaced 6 inches (15 cm) apart. Figure 3–11 illustrates taxiway centerline and edge markings.

(2) Taxiway to parking position transition requirements. For paved taxiways and parking areas, taxiway centerline markings continue into parking positions and become the parking position centerlines.

f. Helicopter parking position markings. Helicopter parking positions have the following markings.

(1) Paved parking position identifications. Mark parking position identifications (numbers or letters) if there is more than one parking position. These markings are yellow characters 36 inches (91 cm) high. See Figure 3–16 and Figure C–1.

(2) Rotor diameter circle. Define the circle of the RD of the largest helicopter that will park at that position with a 6-inch (15 cm) wide, solid yellow line with an outside diameter of RD. See Figure 3–12.

(3) Touchdown/positioning circle (TDPC) marking. An optional TDPC marking provides guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot's seat is over the marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2} D$ and a line width of 18 in (46 cm). Locate a TDPC marking in the center of a parking area. See Figure 3–16. The FAA recommends a TDPC marking for "turn-around" parking areas.

(4) Maximum length marking. This marking on paved surfaces indicates the D of the largest helicopter that the position will accommodate (for example, 49). This marking is in yellow characters at least 36 inches (91 cm) high. See Figure 3–17 and Figure C–1.

(5) Parking position weight limit. If a paved parking position has a weight limitation, mark it in units of 1,000 lbs as illustrated in Figure 3–16. (A "12" indicates a weight-carrying capability of up to 9,000 lbs. Do not use metric equivalents for this purpose.) This marking consists of yellow characters 36 inches (91 cm) high. When necessary to minimize the possibility of being misread, place a bar under the number. See Figure 3–17 and Figure C–1.

(6) Shoulder line markings. Use optional shoulder line markings for paved parking areas (Figure 3–12) to ensure safe rotor clearance. Locate a 6-inch (15 cm) wide solid yellow shoulder line, perpendicular to the centerline and extending to the RD marking, so it is under the pilot's shoulder. This ensures the main rotor of the largest helicopter the position will accommodate will be entirely within the rotor diameter parking circle. See Figure 3–16. The FAA recommends a shoulder line marking for "taxi through" parking areas.

(7) Walkways. Figure 3–12 illustrates one marking scheme.

g. Closed heliport. Obliterate all markings of a permanently closed heliport, FATO, or TLOF. If it is impractical to obliterate markings, place a yellow "X" over the "H", as illustrated in Figure 3–19. Make the yellow "X" large enough to ensure early pilot recognition that the heliport is closed. Remove the wind cone(s) and other visual indications of an active heliport.

h. Marking sizes. See Appendix C for guidance on the proportions of painted numbers.

Figure 3–19. Marking a Closed Heliport: Transport

315. Heliport lighting. For night operations, light the heliport with FATO and/or TLOF perimeter lights as described below. Design flush light fixtures and installation methods to support point loads of the design helicopter transmitted through a skid or wheel.

a. TLOF – perimeter lights. Use flush green lights meeting the requirements of FAA Airports Engineering Brief 87, Heliport Perimeter Light for Visual Meteorological Conditions (VMC), to define the TLOF perimeter. Use a minimum of four light fixtures per side of the TLOF. Locate a light is located at each corner, with additional lights uniformly spaced between the corner lights. Using an odd number of lights on each side will place lights along the centerline of the approach. Install lights at a maximum spacing of 25 feet (7.6 m). Locate flush lights within 1 foot (30 cm) (inside or outside) of the TLOF perimeter. Figure 3–20 and Figure 3–21 illustrate this lighting.

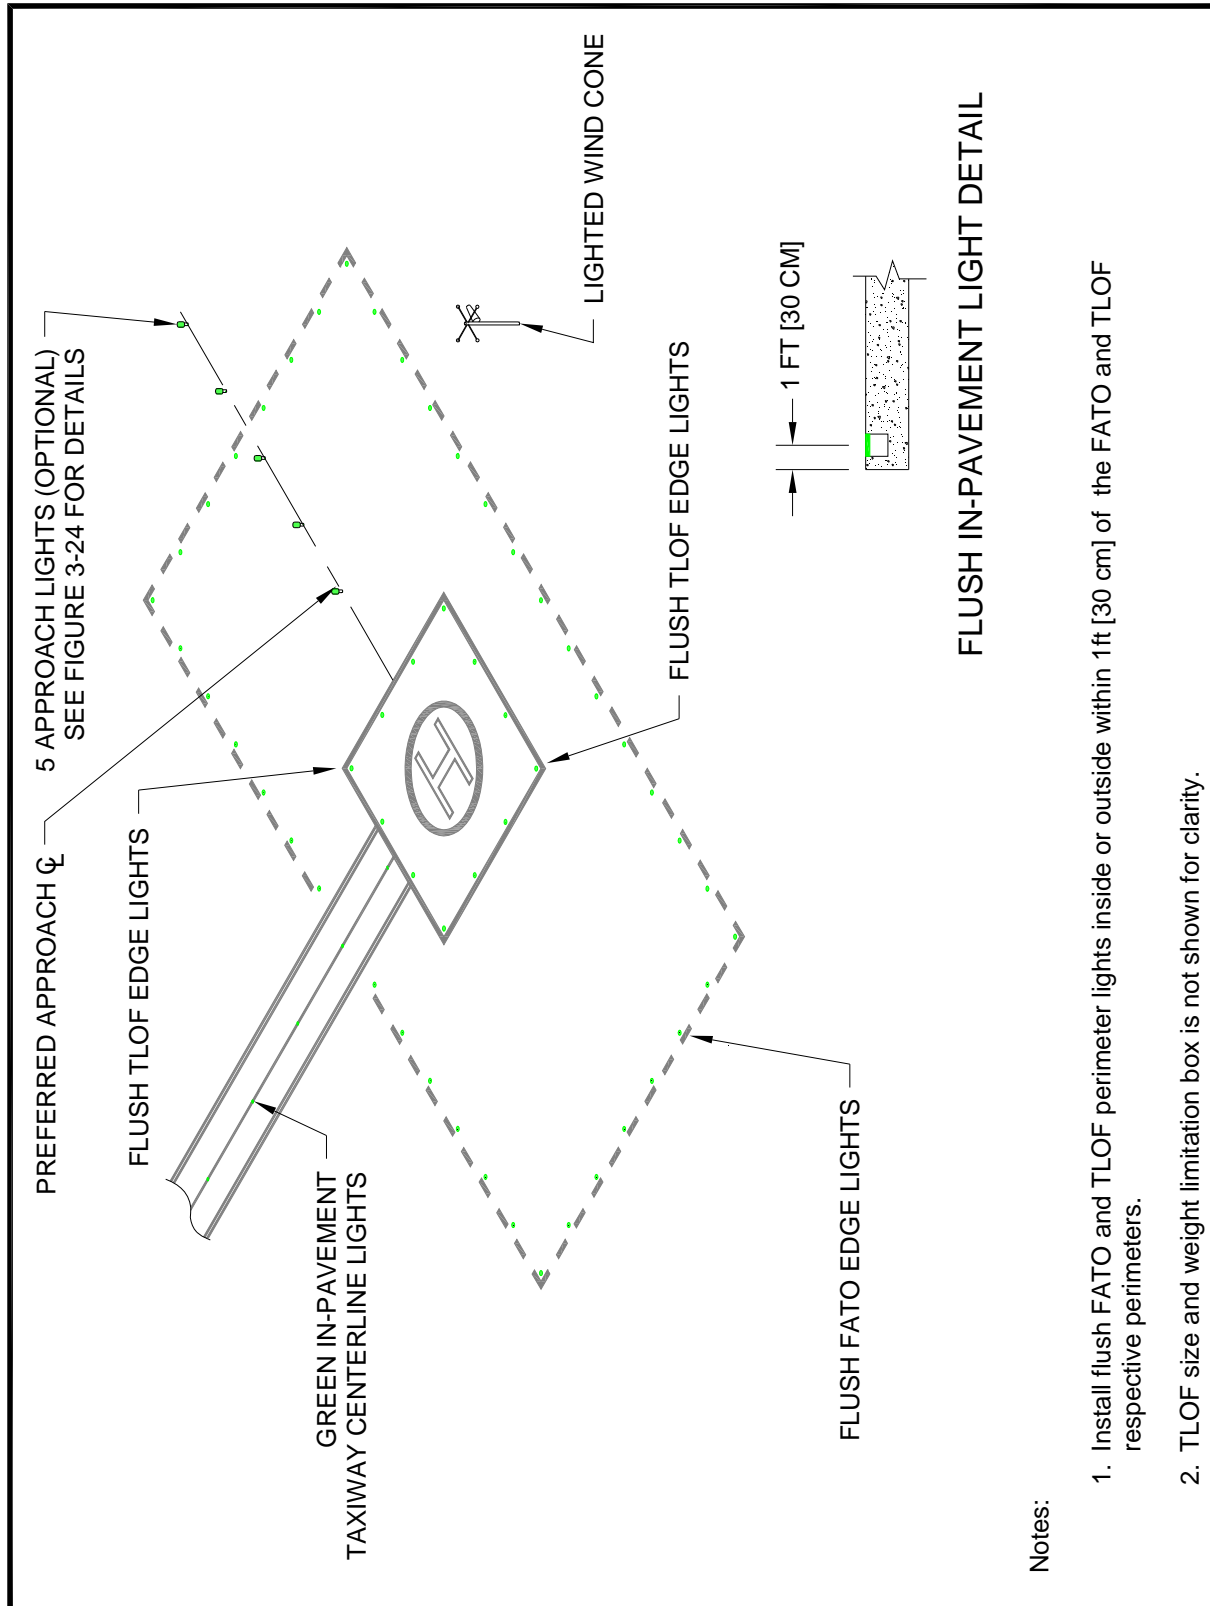

Figure 3–20. TLOF and FATO Flush Perimeter Lighting: Transport

Figure 3–21. FATO Raised and TLOF Flush Perimeter Lighting: Transport

b. Optional TLOF lights. As an option, install a line of 7 green, flush lights meeting the standards of EB 87 spaced at 5-foot (1.5 m) intervals in the TLOF pavement. Align these lights on the centerline of the approach course to provide close-in directional guidance and improve TLOF surface definition. These lights are illustrated in Figure 3–22.

c. Ground level FATO perimeter lights. Use green lights meeting the requirements of EB 87 to define the limits of the FATO. Locate a light at each corner with additional lights uniformly spaced between the corner lights with a maximum interval of 25 feet (8 m) between lights. Using an odd number of lights on each side will place lights along the centerline of the approach. Locate flush lights within 1 foot (30 cm) inside or outside of the FATO perimeter. Mount raised light fixtures frangibly, no more than 8 inches (20 cm) high, and locate them 10 feet (3 m) out from the FATO perimeter. Make sure they do not penetrate a horizontal plane at the FATO elevation by more than 2 inches (5 cm). See Figure 3–21 and Figure 7–3.

d. Elevated FATO – perimeter lights. Lighting for an elevated FATO is the same as for a ground level FATO. As an option, locate lights at the outside edge of the safety net, as shown in Figure 3–23. Make sure the raised lights do not penetrate a horizontal plane at the FATO elevation by more than 2 inches (5 cm). See Figure 7–3.

e. Floodlights. Use floodlights to illuminate the parking apron. If possible, mount these floodlights on adjacent buildings to eliminate the need for tall poles. Take care, however, to place floodlights clear of the TLOF, the FATO, the safety area, and the approach/departure surfaces and transitional surfaces and ensure the floodlights and their associated hardware do not constitute an obstruction hazard. Aim floodlights down to provide illumination on the apron surface. Make sure floodlights that might interfere with pilot vision during takeoff and landings are capable of being turned off by pilot control or at pilot request.

f. Landing direction lights. As an option when it is necessary to provide directional guidance, install landing direction lights. Landing direction lights are a configuration of five green omnidirectional lights meeting the standards of EB 87 on the centerline of the preferred approach/departure path. Space these lights at 15-foot (4.6 m) intervals beginning at a point not less than 30 feet (9 m) and not more than 60 feet (18 m) from the TLOF perimeter and extending outward in the direction of the preferred approach/departure path, as illustrated in Figure 3–24.

g. Flight path alignment lights. As an option, install flight path alignment lights meeting the requirements of EB 87. Place them in a straight line along the direction of approach and/or departure flight paths, extending as necessary across the TLOF, FATO, safety area or any suitable surface in the immediate vicinity of the FATO or safety area. Install three or more green lights spaced at 5 feet (1.5 m) to 10 feet (3.0 m). See Figure 3–9.

Figure 3–22. Optional TLOF Lights: Transport

Figure 3–23. Elevated FATO – Perimeter Lighting: Transport

Figure 3-24. Landing Direction Lights: Transport

h. Taxiway and taxi route lighting.

(1) Taxiway centerline lights. Define taxiway centerlines with flush bidirectional green lights meeting the standards of AC 150/5345-46, Specification for Runway and Taxiway Light Fixtures, for type L-852A (straight segments) or L-852B (curved segments). Space these lights at maximum 50-foot (15 m) longitudinal intervals on straight segments and at maximum 25-foot (7.6 m) intervals on curved segments, with a minimum of four lights needed to define the curve. As an option, uniformly offset taxiway centerline lights no more than two feet (0.6 m) to ease painting the taxiway centerline. Do not use retroreflective markers.

(2) Taxiway edge lights. Use flush omnidirectional blue lights meeting the standards of AC 150/5345-46 for type L-852T to mark the edges of a taxiway. Do not use retroreflective markers.

(a) Straight segments. Space lights at 50-foot (15.2 m) longitudinal intervals on straight segments.

(b) Curved segments. Curved taxiway edges require shorter spacing of edge lights. Base the spacing on the radius of the curve. AC 150/5340-30, Design and Installation Detail for Airport Visual Aids shows the applicable spacing for curves. Space taxiway edge lights uniformly. On curved edges of more than 30 degrees from point of tangency (PT) of the taxiway section to PT of the intersecting surface, install have at least three edge lights. For radii not listed in AC 150/5340-30, determine spacing by linear interpolation.

i. **Heliport identification beacon.** Install a heliport identification beacon. Locate the beacon, flashing white/green/yellow at the rate of 30 to 45 flashes per minute, on or close to the heliport. Find guidance on heliport beacons in AC 150/5345-12, Specification for Airport and Heliport Beacon.

316. Marking and lighting of difficult-to-see objects. It is difficult for a pilot to see unmarked wires, antennas, poles, cell towers, and similar objects, even in the best daylight weather, in time to take evasive action. While pilots can avoid such objects during en route operations by flying well above them, approaches and departures require operations near the ground where obstacles may be a factor. This paragraph discusses the marking and lighting of objects near, but outside and below the approach/departure surface. Find guidance on marking and lighting objects in AC 70/7460-1, Obstruction Marking and Lighting.

a. **Airspace.** If difficult-to-see objects penetrate the object identification surfaces illustrated in Figure 3-25 and Figure 3-26, mark these objects to make them more conspicuous. If a heliport supports operations between dusk and dawn, light these difficult-to-see objects. The object identification surfaces in Figure 3-25 and Figure 3-26 are described as follows:

(1) In all directions from the safety area except under the approach/departure paths, the object identification surface starts at the safety area perimeter and extends out horizontally for a distance of 100 feet (30.5 m).

(2) Under the approach/departure surface, the object identification surface starts from the outside edge of the FATO and extends horizontally out along the approach path for a distance of 800 feet (244 m). From this point, the object identification surface extends out for an additional distance of 3,200 feet (975 m) along the approach path while rising on an 8:1 slope (8 units horizontal in 1 unit vertical). From the point 800 feet (244 m) from the FATO perimeter, the object identification surface is 100 feet (30.5 m) beneath the approach/departure surface.

(3) The width of this object identification surface under the approach/departure surface increases as a function of distance from the safety area. From the safety area perimeter, the object identification surface extends laterally to a point 100 feet (30.5 m) outside the safety area perimeter. At the upper end of the surface, the object identification surface extends laterally 200 feet (61 m) on either side of the approach/departure path.

b. Shielding of objects. Title 14 CFR Part 77.9, Construction or alteration requiring notice, provides that if there are a number of objects close together, it may not be necessary to mark all of them if they are shielded. To meet the shielding guidelines part 77 requires that an object “be shielded by existing structures of a permanent and substantial nature or by natural terrain or topographic features of equal or greater height, and will be located in the congested area of a city, town, or settlement where the shielded structure will not adversely affect safety in air navigation.”

**Figure 3–25. Airspace Where Marking and Lighting are Recommended:
Straight Approach: Transport**

Figure 3-26. Airspace Where Marking and Lighting are Recommended:
Curved Approach: Transport

c. Equipment/object marking. Make heliport maintenance and servicing equipment, as well as other objects used in the airside operational areas, conspicuous with paint, reflective paint, reflective tape, or other reflective markings. Reference AC 150/5210-5, Painting, Marking, and Lighting of Vehicles Used on an Airport.

317. Safety considerations. Consider the safety enhancements discussed below in the design of a heliport. Address other areas, such as the effects of rotor downwash, based on site conditions and the design helicopter.

a. Security. Provide a means to keep the operational areas of a heliport clear of people, animals, and vehicles. Use a method to control access depending upon the helicopter location and types of potential intruders.

(1) **Safety barrier.** At ground-level transport heliports, erect a safety barrier around the helicopter operational areas in the form of a fence or a wall. Construct the barrier no closer to the operation areas than the outer perimeter of the safety area. Make sure the barrier does not penetrate any approach/departure (primary or transitional) surface. If necessary in the vicinity of the approach/departure paths, install the barrier well outside the outer perimeter of the safety area.

(2) Make sure any barrier is high enough to present a positive barrier to persons inadvertently entering an operational area and yet low enough to be non-hazardous to helicopter operations.

(3) Control access to airside areas with locked gates and doors. Display a cautionary sign similar to that illustrated in Figure 3–27 on gates and doors.

b. Rescue and fire-fighting services. Heliports are subject to state and local rescue and fire-fighting regulations. Provide a fire hose cabinet or extinguisher at each access gate and each fueling location. At elevated TLOF/FATOs, locate fire hose cabinets, fire extinguishers, and other fire-fighting equipment adjacent to, but below the level, of the TLOF/FATO. Find additional information in various NFPA publications. For more reference material, see Appendix D.

c. Communications. Use a Common Traffic Advisory Frequency (CTAF) radio to provide arriving helicopters with heliport and traffic advisory information but do not use this radio to control air traffic. Contact the Federal Communications Commission (FCC) for information on CTAF licensing.

d. Weather information. An automated weather observing system (AWOS) measures and automatically broadcasts current weather conditions at the heliport site. When installing an AWOS, locate it at least 100 feet (30 m) and not more than 700 feet (213 m) from the TLOF and such that its instruments will not be affected by rotor wash from helicopter operations. Find guidance on AWOS systems in AC 150/5220-16, Automated Weather Observing Systems (AWOS) for Non-Federal Applications, and FAA Order 6560.20, Siting Criteria for Automated Weather Observing Systems (AWOS). Other weather observing systems will have different siting criteria.

e. Winter operations. Swirling snow raised by a helicopter's rotor wash can cause the pilot to lose sight of the intended landing point and/or hide objects that need to be avoided. Design the heliport to accommodate the methods and equipment to be used for snow removal. Design the heliport to allow the snow to be removed sufficiently so it will not present an obstruction hazard to either the tail rotor or the main rotor. Find guidance on winter operations in AC 150/5200-30, Airport Winter Safety and Operations.

Figure 3-27. Caution Sign: Transport

318. Visual glideslope indicators (VGSI). A visual glideslope indicator (VGSI) provides pilots with visual vertical course and descent cues. Install the VGSI such that the lowest on-course visual signal provides a minimum of 1 degree of clearance over any object that lies within 10 degrees of the approach course centerline.

a. Siting. The optimum location of a VGSI is on the extended centerline of the approach path at a distance that brings the helicopter to a hover with the undercarriage between 3 and 8 feet (0.9 to 2.4 m) above the TLOF. Figure 3–28 illustrates VGSI clearance criteria. To properly locate the VGSI, estimate the vertical distance from the undercarriage to the pilot’s eye.

b. Control of the VGSI. As an option, allow the VGSI to be pilot controllable such that it is “on” only when needed.

c. VGSI needed. A VGSI is an optional feature. However, provide a VGSI if one or more of the following conditions exist, especially at night:

(1) Obstacle clearance, noise abatement, or traffic control procedures require a particular slope to be flown.

(2) The environment of the heliport provides few visual surface cues.

d. Additional guidance. AC 150/5345-52, Generic Visual Glideslope Indicators (GVGI), and AC 150/5345-28, Precision Approach Path Indicator (PAPI) Systems, provide additional guidance.

Figure 3-28. Visual Glideslope Indicator Siting and Clearance Criteria: Transport

319. Terminal facilities.

a. Design considerations. A heliport terminal provides curbside access for passengers using private autos, taxicabs, and public transit vehicles. Public waiting areas need the usual amenities, and a counter for rental car services may be desirable. Design passenger auto parking areas to accommodate current requirements, with the ability to expand them to meet future requirements. Readily available public transportation may reduce the requirement for employee and service personnel auto parking spaces. Build attractive and functional heliport terminal buildings or sheltered waiting areas. Find guidance on designing terminal facilities in AC 150/5360-9, Planning and Design of Airport Terminal Building Facilities at Non-Hub Locations.

b. Security. Unless screening was carried out at the helicopter passengers' departure location, Transportation Security Administration regulations may require that a screening area and/or screening be provided before passengers enter the airport's secured areas. If needed, provide multiple helicopter parking positions and/or locations in the terminal area to service helicopter passenger and/or cargo interconnecting needs. Find information about passenger screening at the Transportation Security Administration web site (<http://www.tsa.gov/public/>).

320. Zoning and compatible land use. Where state and local statutes permit, the FAA encourages transport heliport operators to promote the adoption of the following zoning measures to ensure the heliport will continue to be available for public use and to protect the community's investment in the facility.

a. Zoning to limit building/object heights. Find general guidance on drafting an ordinance that would limit building and object heights in AC 150/5190-4, A Model Zoning Ordinance to Limit Height of Objects Around Airports. Substitute the heliport surfaces for the airport surfaces described in the model ordinance.

b. Zoning for compatible land use. The FAA encourages public agencies to enact zoning ordinances to control the use of property within the HPZ and the approach/departure path environment, restricting activities to those that are compatible with helicopter operations. See paragraph 310.

c. Air rights and property easements. Use air rights and property easements as options to prevent the encroachment of obstacles in the vicinity of a heliport.

This page intentionally left blank.

Chapter 4. Hospital Heliports

401. General. Helicopters are often used to transport injured persons from the scene of an accident to a hospital and to transfer patients from one hospital to another. A hospital heliport accommodates helicopters used by Emergency Medical Services. In some emergencies, a hospital heliport may accommodate large military helicopters.

402. Applicability. The standards in this chapter apply to projects funded under the Airport Improvement Program (AIP) or Passenger Facility Charge (PFC) program. For other projects/heliports, these standards are the FAA's recommendations for designing all hospital heliports. This chapter highlights issues that are unique to hospital heliports and issues for which the design standards are different than those recommended for other general aviation heliports, but also includes standards that are common to other general aviation heliports. These standards address the design of a heliport that will accommodate air ambulance helicopter operations and emergency medical service (EMS) personnel and equipment. These standards are based on the understanding that pilots landing at the heliport are familiar with the facility. However, the heliport operator assumes the responsibility of ensuring the necessary information is readily available to pilots. Alternately, the heliport operator may choose to build the heliport to full general aviation standards. The design standards in this chapter assume there will never be more than one helicopter within the final approach and takeoff area (FATO) and the associated safety area. If there is a need for more than one touchdown and lift-off area (TLOF) at a heliport, locate each TLOF within its own FATO. Consider the feasibility of accommodating large military helicopters that might be used in an emergency.

403. Access by individuals with disabilities. Various laws require heliports operated by public entities and those receiving federal financial assistance to meet accessibility requirements. See paragraph 114.

404. Heliport site selection.

a. Planning. Public agencies and others planning to develop a hospital heliport are encouraged to select a site capable of supporting instrument operations, future expansion, and military helicopters that will be used in disaster relief efforts.

b. Property requirements. A functional hospital heliport may be as simple as a cleared area on the ground, together with a wind cone and a clear approach/departure path. Figure 4-1 illustrates the essential elements of a ground-level hospital heliport.

c. Turbulence. Air flowing around and over buildings, stands of trees, terrain irregularities, etc. can create turbulence on ground-level and roof-top heliports that may affect helicopter operations. Where the FATO is located near the edge and top of a building or structure, or within the influence of turbulent wakes from other buildings or structures, assess the turbulence and airflow characteristics in the vicinity of, and across the surface of the FATO to determine if an air-gap between the roof, roof parapet or supporting structure, and/or some other turbulence mitigating design measure is necessary. FAA Technical Report FAA/RD-84/25, Evaluating Wind Flow Around Buildings on Heliport Placement, addresses the wind's effect on helicopter operations. Take the following actions in selecting a site to minimize the effects of turbulence.

(1) Ground-level heliports. Features such buildings, trees, and other large objects can cause air turbulence and affect helicopter operations from sites immediately adjacent to them. Therefore, locate the landing and takeoff area away from such objects in order to minimize air turbulence in the vicinity of the FATO and the approach/departure paths.

(2) **Elevated heliports.** Establishing a 6 foot (1.8 m) or more air gap on all sides above the level of the roof will generally minimize the turbulent effect of air flowing over the roof edge. If an air gap is included in the design, keep it free at all times of objects that would obstruct the airflow. If it is not practical to include an air gap or some other turbulence mitigating design measure where there is turbulence, operational limitations may need to be considered under certain wind conditions. See paragraph 101.

d. Electromagnetic effects. Nearby electromagnetic devices, such as a magnetic resonance imaging machine (MRI), large ventilator motor, elevator motor, or other large electrical consumer may cause temporary aberrations in the helicopter magnetic compass and interfere with other onboard navigational equipment. Be alert to the location of any MRI with respect to the heliport location. A warning sign alerting pilots to the presence of an MRI is recommended. Take steps to inform pilots of the locations of MRIs and other similar equipment. For additional information, see FAA Technical Report FAA/RD-92/15, Potential Hazards of Magnetic Resonance Imagers to Emergency Medical Service Helicopter Services.

Figure 4–1. Essential Features of a Ground-level Hospital Heliport: Hospital

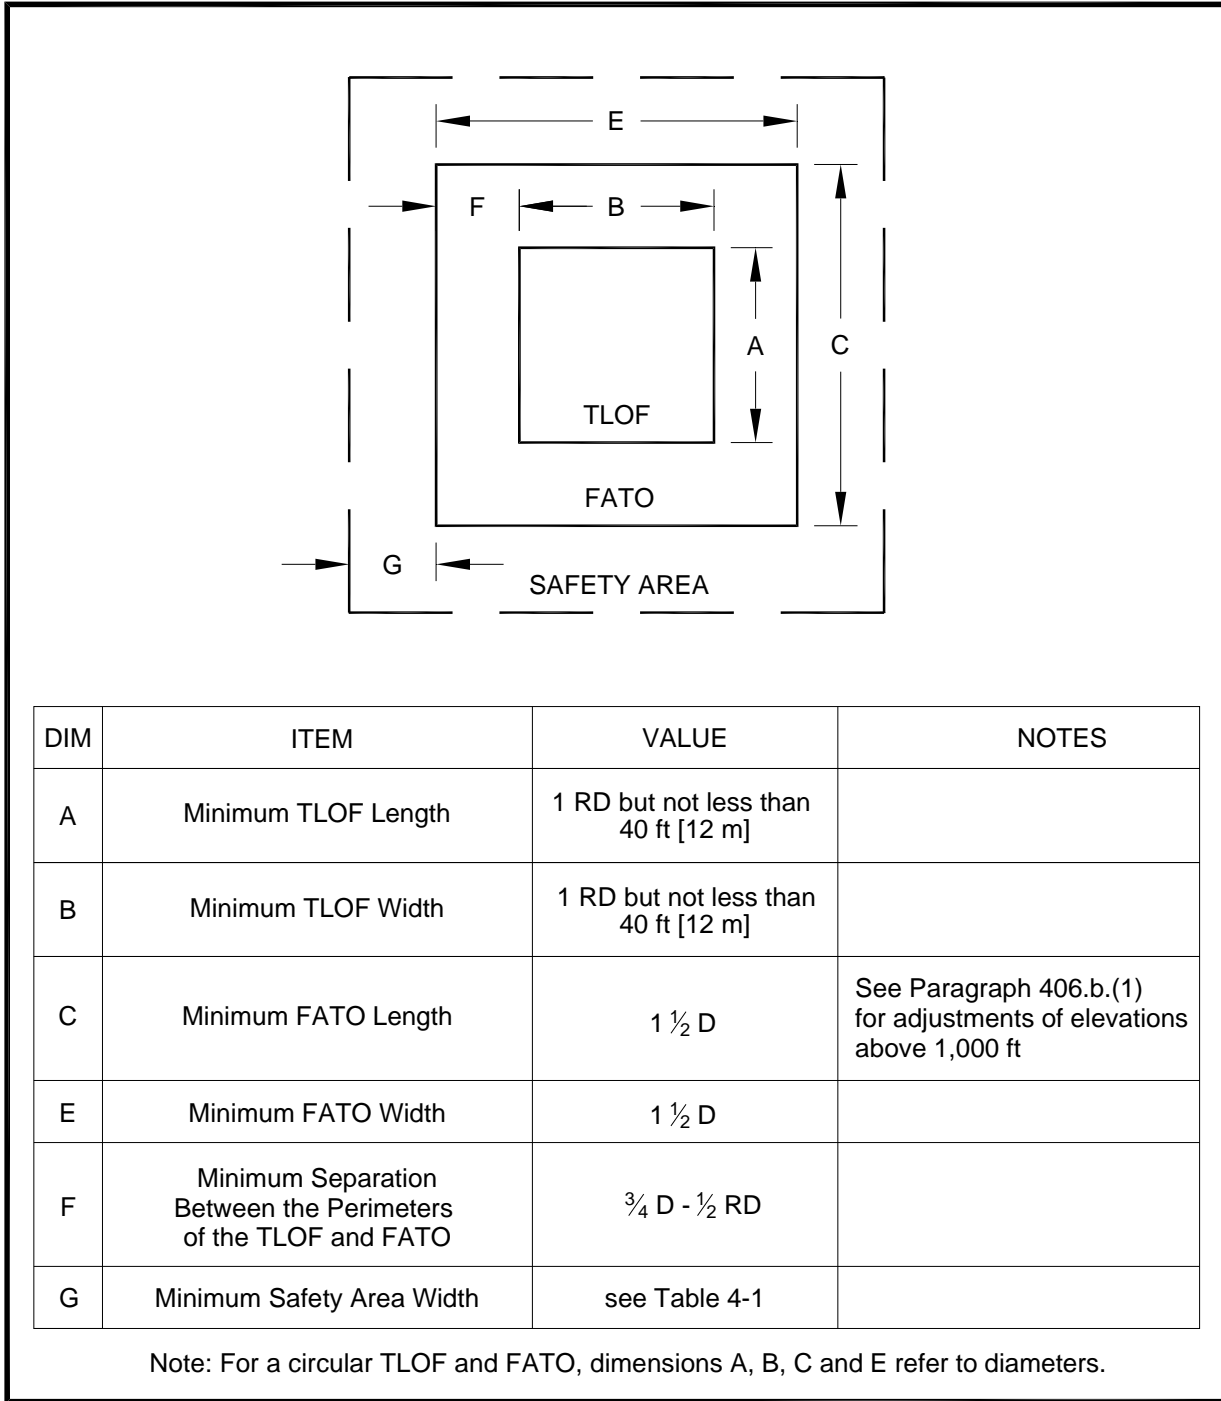

Figure 4-2. TLOF/FATO Safety Area Relationships and Minimum Dimension: Hospital

405. Basic layout. The heliport consists of a TLOF contained within a FATO. A safety area surrounds the FATO. The relationship of the TLOF to the FATO and the safety area is shown in Figure 4-2. A FATO contains only one TLOF. Provide appropriate approach/departure airspace to allow safe approaches to and departures from landing sites. To the extent feasible, align the preferred approach/departure path with the predominant winds. See paragraph 409.

406. Touchdown and liftoff area (TLOF).

a. TLOF location. TLOFs of hospital heliports are at ground level, on an elevated structure, or at rooftop level. Center the TLOF within the FATO.

b. TLOF size. The minimum TLOF dimension (length, width, or diameter) is equal to the rotor diameter (RD) of the design helicopter but not less than 40 feet (12 m). Design the TLOF to be rectangular or circular. Each design shape has its advantages. A square or rectangular shape provides the pilot with better alignment cues than a circular shape, but a circular TLOF may be more recognizable in an urban environment. Increasing the load-bearing area (LBA) centered on the TLOF may provide some safety and operational advantages. Increasing the TLOF dimensions may enhance safety factors and/or operational efficiency.

(1) Elevated hospital heliport. If the FATO outside the TLOF is non-load-bearing, increase the minimum width, length or diameter of the TLOF to the overall length (D) of the design helicopter.

(2) Elongated TLOF. An elongated TLOF can provide an increased safety margin and greater operational flexibility. As an option, design an elongated TLOF with a landing position in the center and two takeoff positions, one at either end, as illustrated in Figure 4-3. Design the landing position to have a minimum length of the RD of the design helicopter. If the TLOF is elongated, also provided an elongated FATO.

c. Ground-level TLOF surface characteristics.

(1) Design loads. Design the TLOF and any supporting TLOF structure to be capable of supporting the dynamic loads of the design helicopter.

(2) Paving. The standard for the TLOF surface is either paved or aggregate-turf (see AC 150/5370-10, Standards for Specifying Construction of Airports items P-217 and P-501). Use portland cement concrete (PCC) when feasible for ground-level facilities. An asphalt surface is less desirable for heliports as it may rut under the wheels or skids of a parked helicopter. This has been a factor in some rollover accidents. Use a broomed or roughened pavement finish to provide a skid-resistant surface for helicopters and non-slippery footing for people.

d. Rooftop and other elevated TLOFs.

(1) Design loads. Design elevated TLOFs and any TLOF supporting structure to be capable of supporting the dynamic loads of the design helicopter.

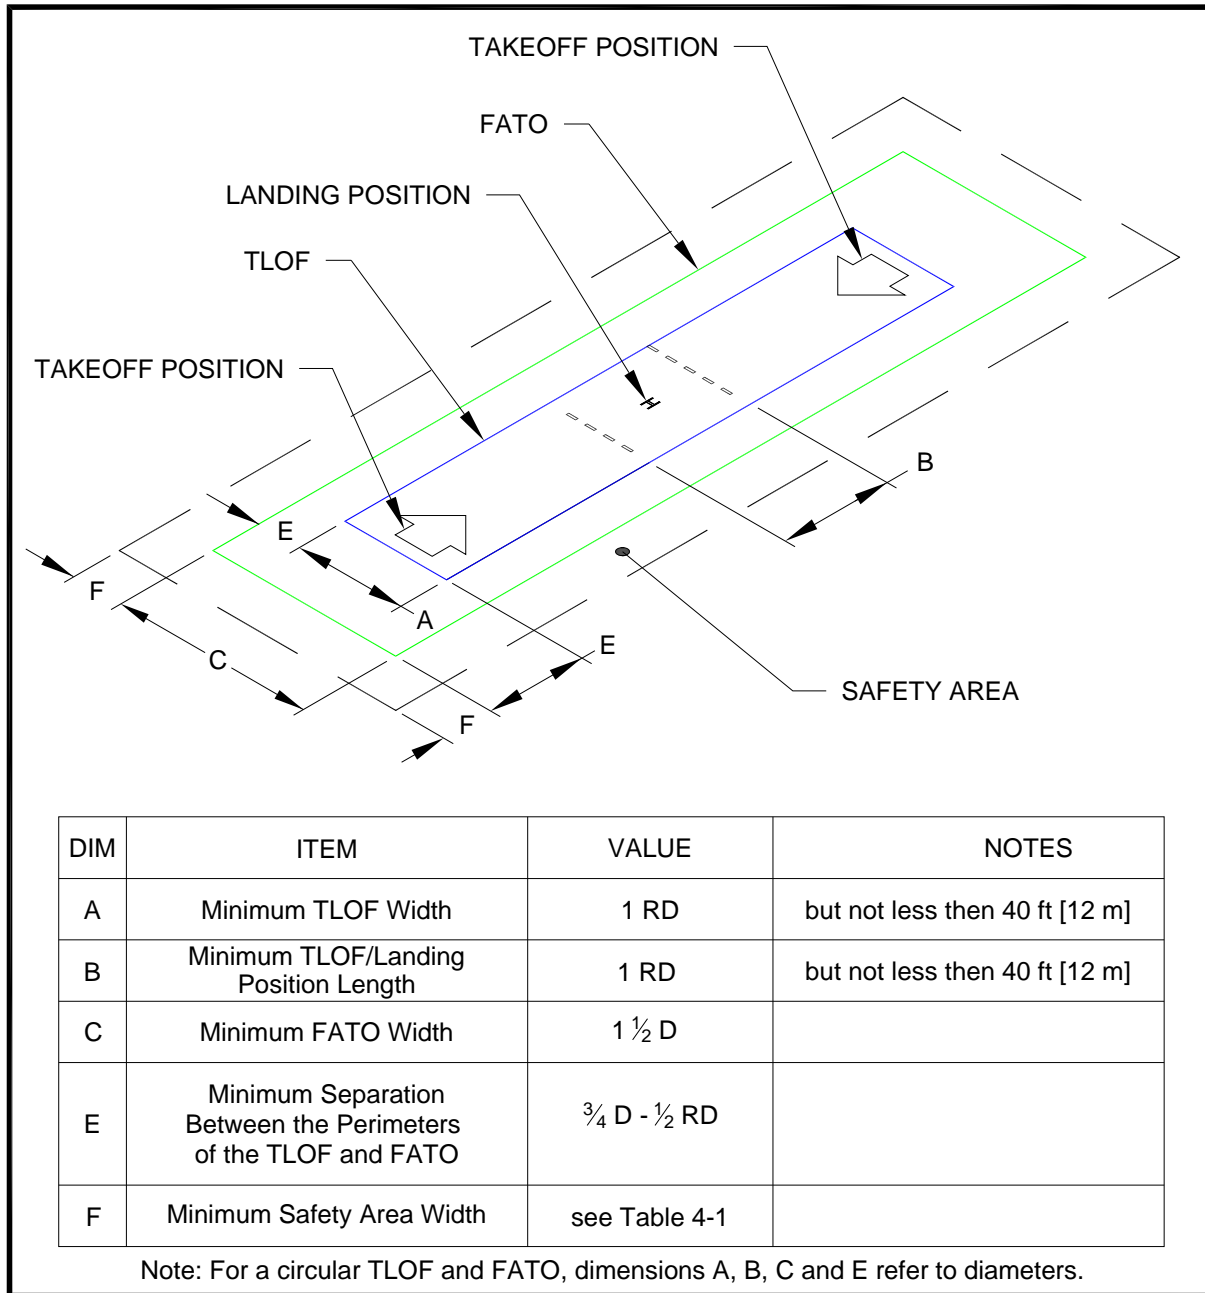

Figure 4-3. Elongated FATO with Two Takeoff Positions: Hospital

(2) Elevation. Elevate the TLOF above the level of any obstacle in the FATO and safety area that cannot be removed. Exception: Edge restraints of minimal height (no higher than 4 inches) on ramps may project above the elevation of the edge of the TLOF.

(3) Obstructions. Elevator penthouses, cooling towers, exhaust vents, fresh-air vents, and other raised features can affect heliport operations. Establish control mechanisms to ensure obstruction hazards are not installed after the heliport is operational.

(4) Air Quality. Helicopter exhaust can affect building air quality if the heliport is too close to fresh air vents. When designing a building intended to support a helipad, locate fresh air vents accordingly. When adding a helipad to an existing building, relocate fresh air vents if necessary or, if

relocation is not practical, installing charcoal filters or a fresh air intake bypass louver system for HVAC systems may be adequate.

(5) TLOF surface characteristics. Construct rooftop and other elevated heliport TLOFs of metal, concrete, or other materials subject to local building codes. Use a finish for TLOF surfaces that provides a skid-resistant surface for helicopters and non-slippery footing for people.

(6) Safety net. If the platform is elevated 4 feet (1.2 m) or more above its surroundings, Title 29 CFR Part 1910.23, Guarding Floor and Wall Openings and Holes, requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences since they would be safety hazards during helicopter operations. As an option, install a safety net, meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load carrying capability of 25 lbs/sq ft (122 kg/sq m). Make sure the net, as illustrated in Figure 4–29, does not project above the level of the TLOF. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

(7) Access to elevated TLOFs. Title 29 CFR Part 1926.34, Means of Egress requires two separate access points for an elevated structure such as an elevated TLOF. Provide access to and from the TLOF via a ramp in order to provide for quick and easy transportation of a patient on a gurney. Build ramps in accordance with state and local requirements. Design the width of the ramp, and any turns in the ramp, to be wide enough to accommodate a gurney with a person walking on each side. Design straight segments of the ramp to be at least 6 feet (1.8 m) wide. Additional width may be required in the turns. Provide the ramp with a slip-resistant surface, with a slope no steeper than 12:1 (12 units horizontal in 1 unit vertical). While it is possible to move a gurney to and from the TLOF using a lift, avoid this, since it invariably results in a delay in the movement of patients in time-critical conditions. Design stairs in compliance with Title 29 CFR Part 1910.24, Fixed Industrial Stairs. Design handrails required by this standard to fold down or be removable to below the level of the TLOF so they will not be hazards during helicopter operations.

e. TLOF gradients. Recommended TLOF gradients are defined in Chapter 7.

407. Final approach and takeoff area (FATO). A hospital heliport has at least one FATO. The FATO contains a TLOF within its borders at which arriving helicopters terminate their approach and from which departing helicopters take off.

a. FATO location. FATOs of hospital heliports are at ground level, on an elevated structure, or on a rooftop. To avoid or minimize the need for additional ground transport, locate the FATO to provide ready access to the hospital's emergency room, but such that buildings and other objects are outside the safety area and below obstacle clearance surfaces. The relationship of the FATO to the TLOF and the safety area is shown in Figure 4–2.

b. FATO size.

(1) Design the FATO so its minimum width, length, or diameter is $1\frac{1}{2}$ times the overall length (D) of the design helicopter. Design the FATO to be circular or rectangular, regardless of the shape of the TLOF. At elevations above 1,000 feet MSL, include a longer FATO to provide an increased safety margin and greater operational flexibility. Use the additional FATO length as depicted in Figure 4–4.

(2) Design the minimum distance between the TLOF perimeter and the FATO perimeter to be not less than $\frac{3}{4}D - \frac{1}{2}RD$, where D is the overall length and RD is the rotor diameter of the design helicopter. Note that if the TLOF and FATO are not of similar shape, this applies at all points of the TLOF perimeter. The relationship of the TLOF to the FATO and the safety area is shown in Figure 4–2.

Figure 4-4. Additional FATO Length for Heliports at Higher Elevation: Hospital

c. FATO Surface characteristics. If the heliport operator marks the TLOF, the FATO outside the TLOF need not be load-bearing.

(1) Ground-level hospital heliports. If the heliport operator does not mark the TLOF, and/or intends that the helicopter be able to land anywhere within the FATO, design the FATO outside the TLOF and any FATO supporting structure, like the TLOF, to be capable of supporting the dynamic loads of the design helicopter.

(2) Elevated hospital heliports. The FATO outside the TLOF may extend into clear airspace. However, there are some helicopter performance benefits and increased operational flexibility if the FATO outside the TLOF is load bearing. Design the FATO outside of the TLOF to be load-bearing unless the minimum width and length or diameter of TLOF is increased to the overall length of the design helicopter.

(3) If the FATO is load bearing, design the portion abutting the TLOF to be contiguous with the TLOF, with the adjoining edges at the same elevation.

(4) If the FATO is unpaved, treat the FATO to prevent loose stones and any other flying debris caused by rotor downwash.

(5) When the FATO or the LBA in which it is located is elevated 4 feet (1.2 m) or more above its surroundings, part 1910.23 requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences, since they would be safety hazards during helicopter operations. As an option, install a safety net, meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load carrying capability of 25 lbs/sq ft (122 kg/sq m). Make sure the net, as illustrated in Figure 4-29,

does not project above the level of the TLOF. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

d. Mobile objects within the FATO. The FATO design standards in this AC assume the FATO is closed to other aircraft if a helicopter or other mobile object is within the FATO or the associated safety area.

e. Fixed objects within the FATO. Remove all fixed objects projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

f. FATO/FATO separation. If a heliport has more than one FATO, separate the perimeters of the two FATOs so the respective safety areas do not overlap. This separation assumes simultaneous approach/departure operations will not take place. If the heliport operator intends for the facility to support simultaneous operations, provide a minimum 200 foot (61 m) separation.

g. FATO gradients. Recommended FATO gradients are defined in Chapter 7.

408. Safety area. A safety area surrounds a FATO.

a. Safety area width. The standards for the width of the safety area are shown in Table 4-1. The width is the same on all sides. The provision or absence of standard heliport markings affects the width standards. As an option, design the safety area to extend into clear airspace.

b. Mobile objects within the safety area. The safety area design standards of this AC assume the TLOF and FATO are closed to other aircraft if a helicopter or other mobile object is within the FATO or the safety area.

c. Fixed objects within a safety area. Remove all fixed objects within a safety area projecting above the FATO elevation except for lighting fixtures, which may project a maximum of 2 inches (5 cm). See Figure 7–3. For ground level heliports, remove all above-ground objects to the extent practicable.

d. Safety area surface. The safety area need not be load bearing. Figure 4–5 depicts a non-load-bearing safety area. If possible, design the portion of the safety area abutting the FATO to be contiguous with the FATO with the adjoining edges at the same elevation. This is needed in order to avoid the risk of catching a helicopter skid or wheel. Clear the safety area of flammable materials and treat the area to prevent loose stones and any other flying debris caused by rotor wash.

e. Safety gradients. Recommended safety area gradients are defined in Chapter 7.

Table 4-1. Minimum VFR Safety Area Width as a Function of Hospital Heliport Markings

TLOF Perimeter Marked	Yes	Yes	No	No
FATO Perimeter Marked	Yes	Yes	Yes	Yes
Standard Hospital Marking Symbol	Yes	No	Yes	No
Hospital heliports	1/3 RD but not less than 10 ft (3 m)**	1/3 RD but not less than 20 ft (6 m)**	1/2 D but not less than 20 ft (6 m)	1/2 D but not less than 30 ft (9 m)
D: overall length of the design helicopter RD: rotor diameter of the design helicopter ** Also applies when the heliport operator does not mark the FATO. Do not mark the FATO if (a) the FATO (or part of the FATO) is a non-load bearing surface and/or (b) the TLOF is elevated above the level of a surrounding load bearing area.				

Figure 4-5. Rooftop Hospital Heliport: Hospital

409. VFR approach/departure paths. The purpose of approach/departure airspace as shown in Figure 4–6 is to provide sufficient airspace clear of hazards to allow safe approaches to and departures from the TLOF.

a. Number of approach/departure paths. Align preferred approach/departure paths with the predominant wind direction so downwind operations are avoided and crosswind operations are kept to a minimum. To accomplish this, design the heliport to have more than one approach/departure path. Base other approach/departure paths on the assessment of the prevailing winds or, when this information is not available, separate such flight paths and the preferred flight path by at least 135 degrees. (See Figure 4–6.) Designing a hospital heliport to have only a single approach/departure path is an undesirable option. A second flight path provides additional safety margin and operational flexibility. If it is not feasible to provide complete coverage of wind through multiple approach/departure paths, operational limitations may be necessary under certain wind conditions. See paragraph 101.

b. VFR approach/departure and transitional surfaces. Figure 4–6 illustrates the approach/departure and transitional surfaces.

(1) An approach/departure surface is centered on each approach/departure path. The approach/departure path starts at the edge of the FATO and slopes upward at 8:1 (8 units horizontal in 1 unit vertical) for a distance of 4,000 feet (1,219 m) where the width is 500 feet (152 m) at a height of 500 feet (152 m) above the heliport elevation.

(2) The transitional surfaces start from the edges of the FATO parallel to the flight path center line, and from the outer edges of approach/departure surface, and extend outwards at a slope of 2:1 (2 units horizontal in 1 unit vertical) for a distance of 250 feet (76 m) from the centerline. The transitional surface is not applied on the FATO edge opposite the approach/departure surface. See Figure 4–6.

(3) Make sure the approach/departure and transitional surfaces are free of penetrations unless an FAA aeronautical study determines such penetrations not to be hazards. The FAA conducts such aeronautical studies only at public heliports; heliports operated by a federal agency or the Department of Defense; and private airports with FAA-approved approach procedures. Paragraph 111 provides additional information on hazards to air navigation.

(4) At hospital heliports, an alternative to considering transitional surfaces is to increase the size of the 8:1 approach/departure surface for a distance of 2,000 feet (610 m) as shown in Figure 2–9 and Figure 2–11. The lateral extensions on each side of the 8:1 approach/departure surface start at the width of the FATO and increase so at a distance of 2,000 feet (610 m) from the FATO they are 100 feet (30 m) wide. Make sure obstacles do not penetrate into both Area A and Area B. Make sure obstacles do not penetrate into Area A or Area B unless the FAA determines that the penetration is not a hazard. Mark or light all such penetrations. See paragraph 111 for more information on hazard determinations.

c. Curved VFR approach/departure paths. As an option, include one curve in VFR approach/departure paths. As an option, design these paths to use the airspace above public lands, such as freeways or rivers. When including a curved portion in the approach/departure path, make sure the sum of the radius of the arc defining the center line and the length of the straight portion originating at the FATO is not less than 1,886 feet (575 m). Design the approach/departure path so the minimum radius of the curve is 886 feet (270 m) and that the curve follows a 1,000 feet (305 m) straight section. Design the approach/departure path so the combined length of the center line of the curved portion and the straight portion is 4,000 feet (1,219 m). See Figure 4–7. Figure 4–9 shows a curved approach/departure path for an 8:1 approach/departure surface.

Figure 4-6. VFR Heliport Approach/Departure and Transitional Surfaces: Hospital

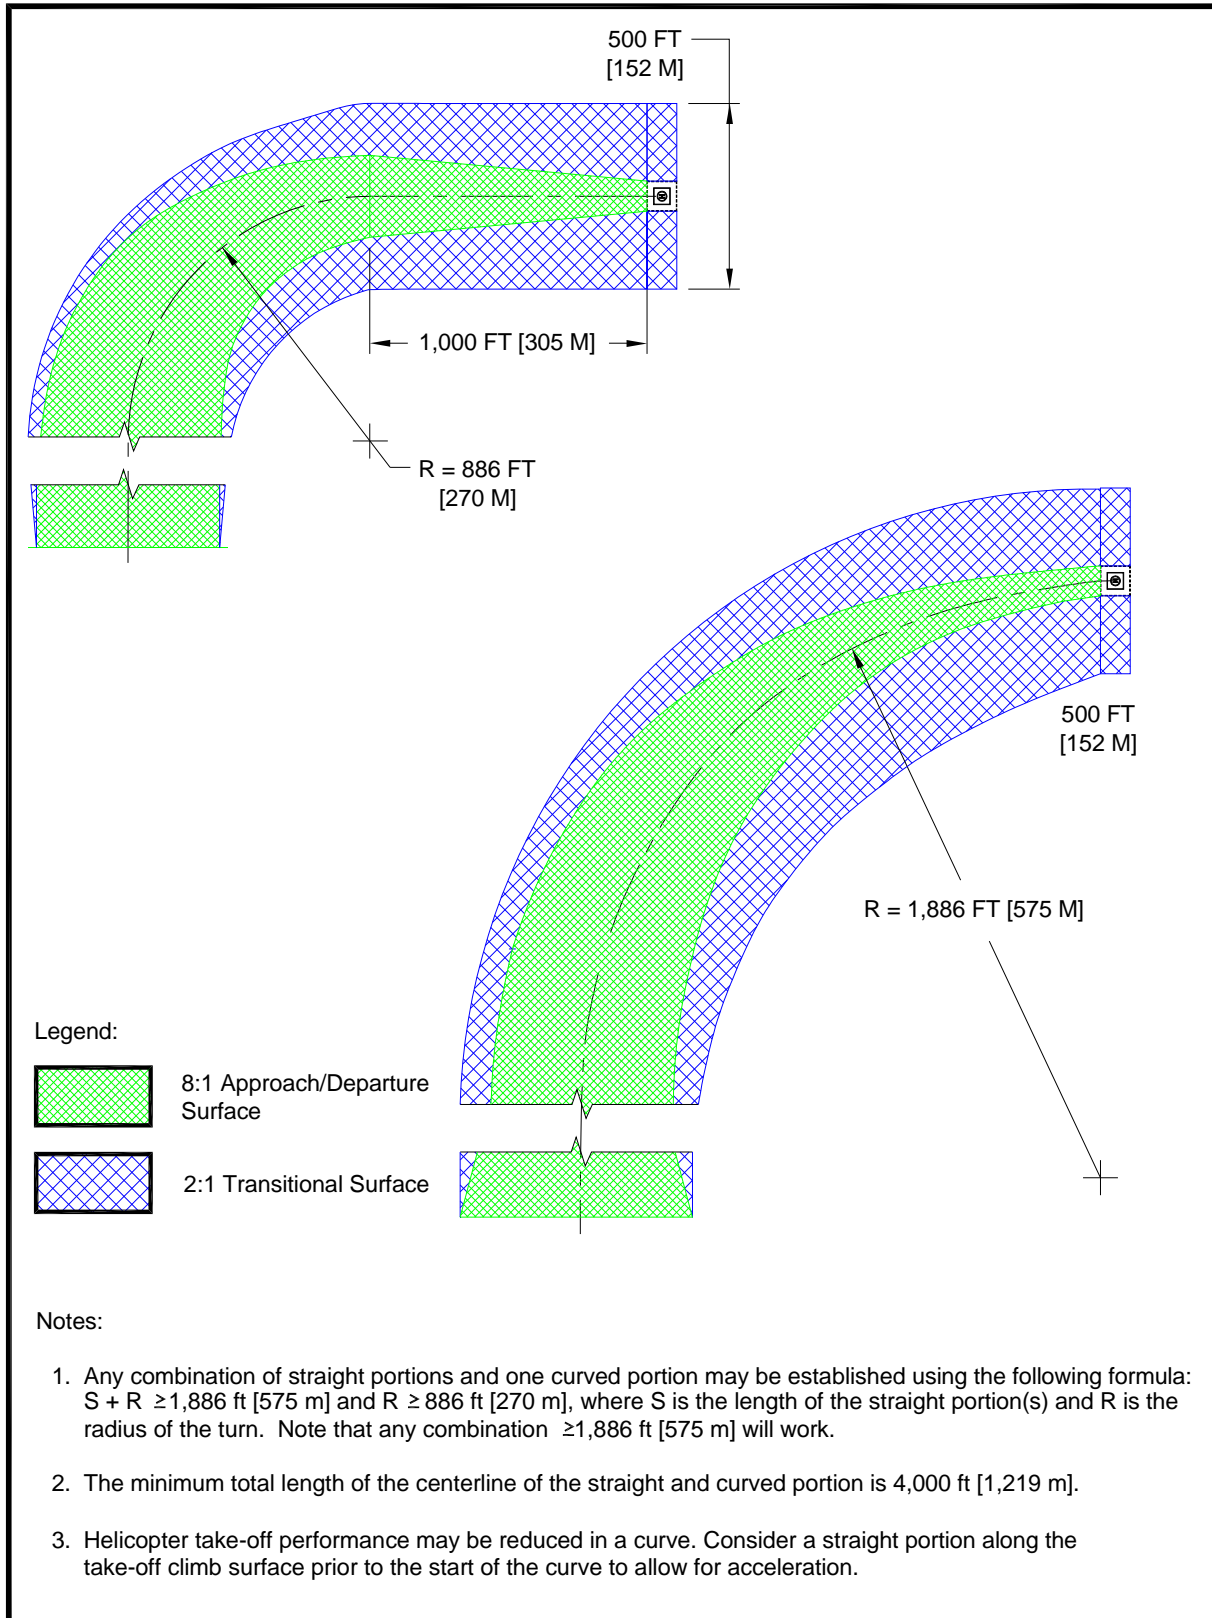

Figure 4-7. Curved Approach/Departure: Hospital

Figure 4-8. VFR Heliport Lateral Extension of the 8:1 Approach / Departure Surface: Hospital

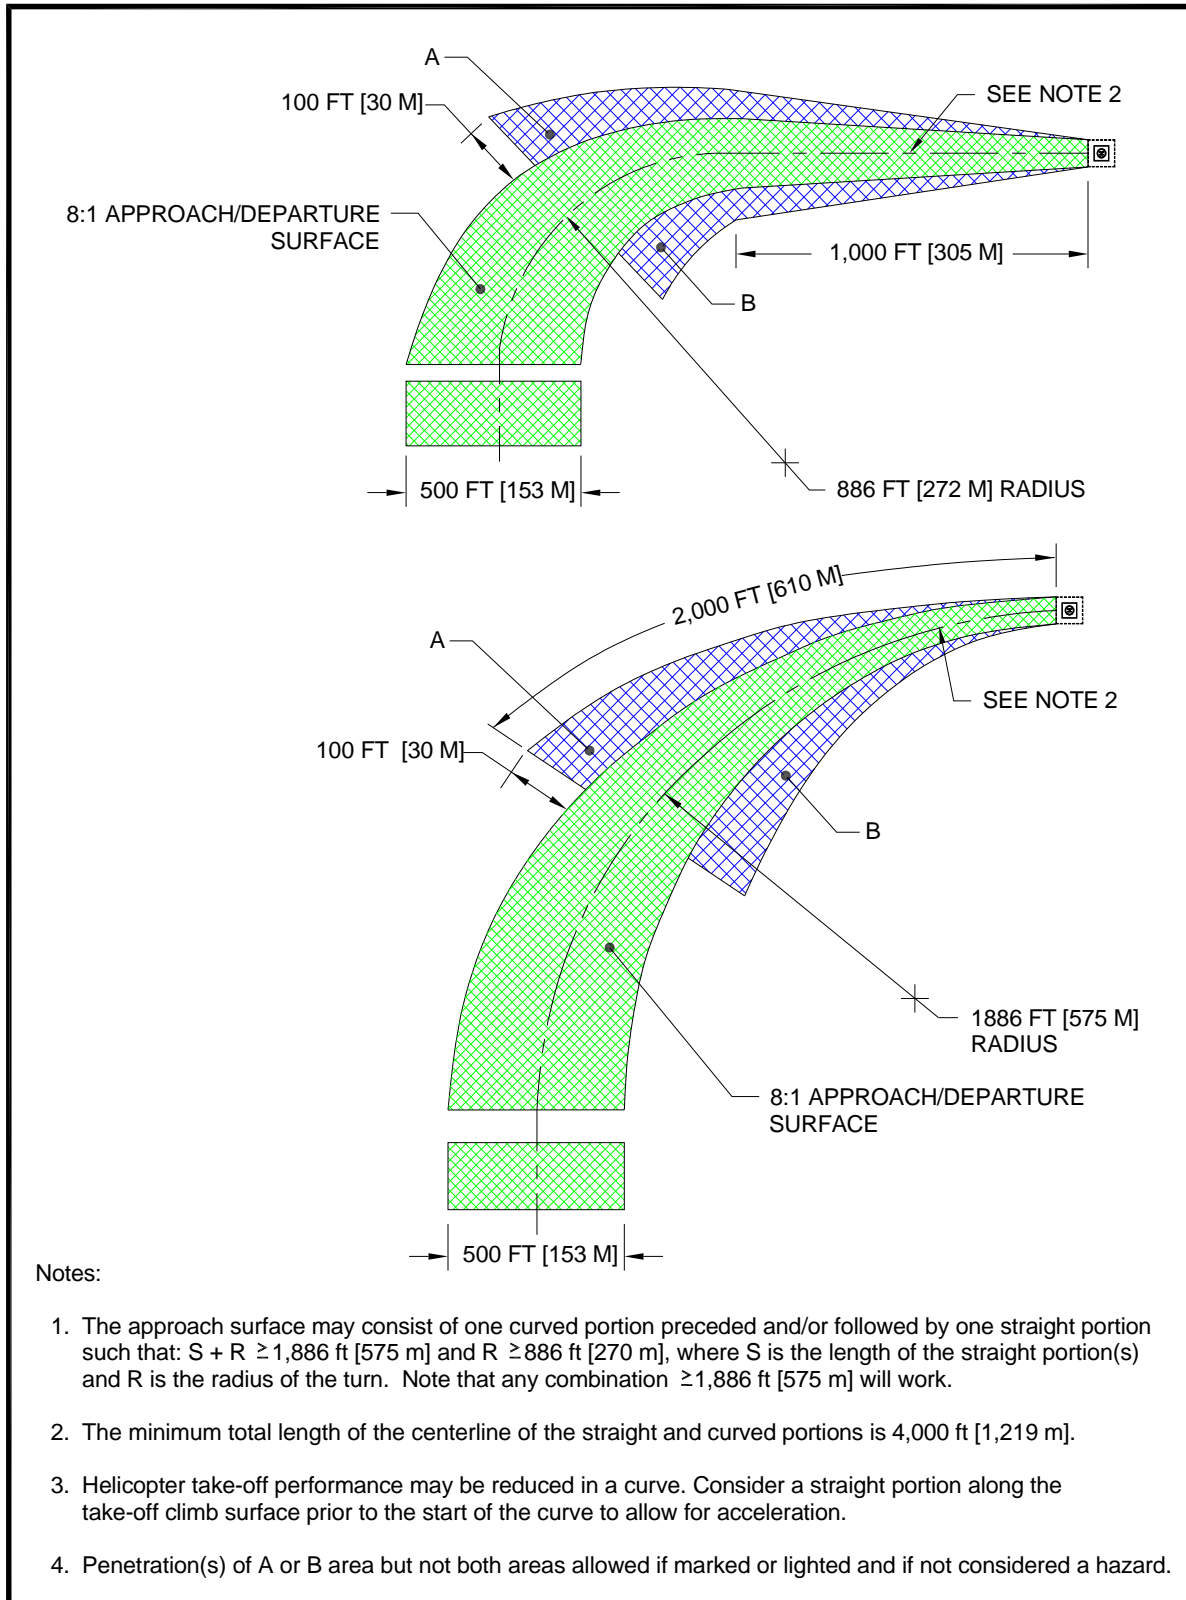

Figure 4-9. VFR Heliport Lateral Extension of the Curved 8:1 Approach/Departure Surface: Hospital

d. Flight path alignment guidance. As an option, use flight path alignment markings and/or flight path alignment lights (see paragraphs 414 and 415) where it is desirable and practicable to indicate available approach and/or departure flight path direction(s). See Figure 4–10.

e. Periodic review of obstructions. Vigilant heliport operators reexamine obstacles in the vicinity of approach/departure paths on at least an annual basis. This reexamination includes an appraisal of the growth of trees near approach and departure paths. Paragraph 111 provides additional information on hazards to air navigation. Pay particular attention to obstacles that need to be marked or lighted. It may be helpful to maintain a list of the GPS coordinates and the peak elevation of obstacles.

410. Heliport protection zone (HPZ) The FAA recommends the establishment of an HPZ for each approach/departure surface. The HPZ is the area under the 8:1 approach/departure surface starting at the FATO perimeter and extending out for a distance of 280 feet (85.3 m), as illustrated in Figure 4–11. The HPZ is intended to enhance the protection of people and property on the ground. This is achieved through heliport owner control over the HPZ. Such control includes clearing HPZ areas (and maintaining them clear) of incompatible objects and activities. The FAA discourages residences and places of public assembly in an HPZ. (Churches, schools, hospitals, office buildings, shopping centers, and other uses with similar concentrations of persons typify places of public assembly.) Do not locate hazardous materials, including fuel, in the HPZ.

411. Wind cone.

a. Specification. Use a wind cone conforming to AC 150/5345-27, Specification for Wind Cone Assemblies, to show the direction and magnitude of the wind. Use a color that provides the best possible color contrast to its background.

b. Wind cone location. Locate the wind cone so it provides the pilot with valid wind direction and speed information in the vicinity of the heliport under all wind conditions.

(1) At many landing sites, there may be no single, ideal location for the wind cone. At other sites, it may not be possible to site a wind cone at the ideal location. In such cases, install more than one wind cone in order to provide the pilot with all the wind information needed for safe operations.

(2) Place the wind cone so a pilot on the approach path is able to see it clearly when the helicopter is 500 feet (150 m) from the TLOF.

(3) Place the wind cone so pilots can see it from the TLOF.

(4) To avoid presenting an obstruction hazard, locate the wind cone(s) outside the safety area, so it does not penetrate the approach/departure or transitional surfaces.

c. Wind cone lighting. For night operations, illuminate the wind cone, either internally or externally, to ensure it is clearly visible.

Figure 4-10. Flight Path Alignment Marking and Lights: Hospital

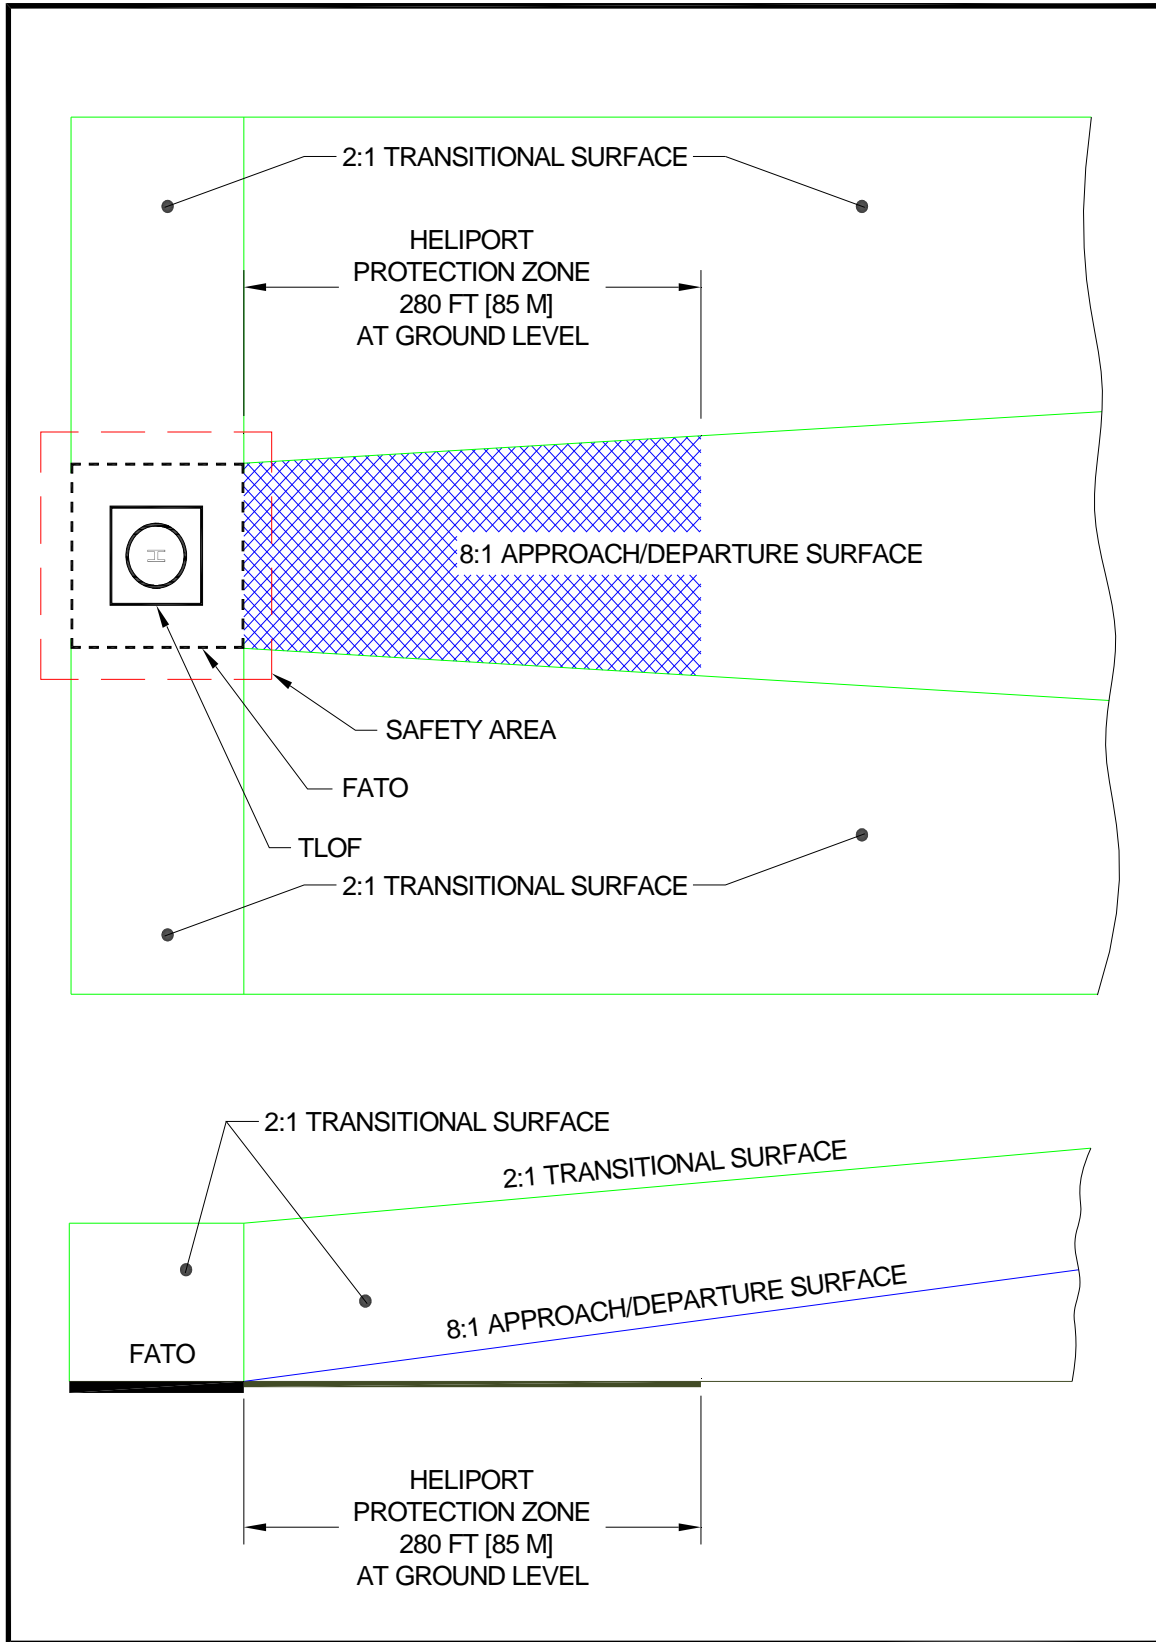

Figure 4-11. Helicopter Protection Zone: Hospital

412. Taxiways and taxi routes. Taxiways and taxi routes provide for the movement of helicopters from one part of a landing facility to another. They provide a connecting path between the FATO and a parking area. They also provide a maneuvering aisle within the parking area. A taxi route includes the taxiway plus the appropriate clearances needed on both sides. The relationship between a taxiway and a taxi route is illustrated in Figure 4–12, Figure 4–13, and Figure 4–14. At hospital heliports with no parking or refueling area outside the TLOF(s), it is not necessary to provide a taxi route or taxiway.

a. Taxiway/taxi route widths. The dimensions of taxiways and taxi routes are a function of helicopter size, taxiway/taxi route marking, and type of taxi operations (ground taxi versus hover taxi). These dimensions are defined in Table 4-2. Normally, the requirement for hover taxi dictates the taxiway/taxi route widths. However, when the fleet comprises a combination of large ground taxiing helicopters and smaller air taxiing helicopters, the larger aircraft may dictate the taxiway/taxi route widths. If wheel-equipped helicopters taxi with wheels not touching the surface, design the facility with hover taxiway widths rather than ground taxiway widths. Where the visibility of the centerline marking cannot be guaranteed at all times, such as locations where snow or dust commonly obscure the centerline marking and it is not practical to remove it, determine the minimum taxiway/taxi route dimensions as if there was no centerline marking.

b. Surfaces. For ground taxiways, provide a surface that is portland cement concrete, asphalt, or a surface, such as turf, stabilized in accordance with the standards of Item P-217 of AC 150/5370-10. For unpaved portions of taxiways and taxi routes, provide a turf cover or treat the surface in some way to prevent dirt and debris from being raised by a taxiing helicopter's rotor wash.

c. Gradients. Taxiway and taxi route gradient standards are defined in Chapter 7.

Figure 4-12. Taxiway/Taxi Route Relationship – Paved Taxiway: Hospital

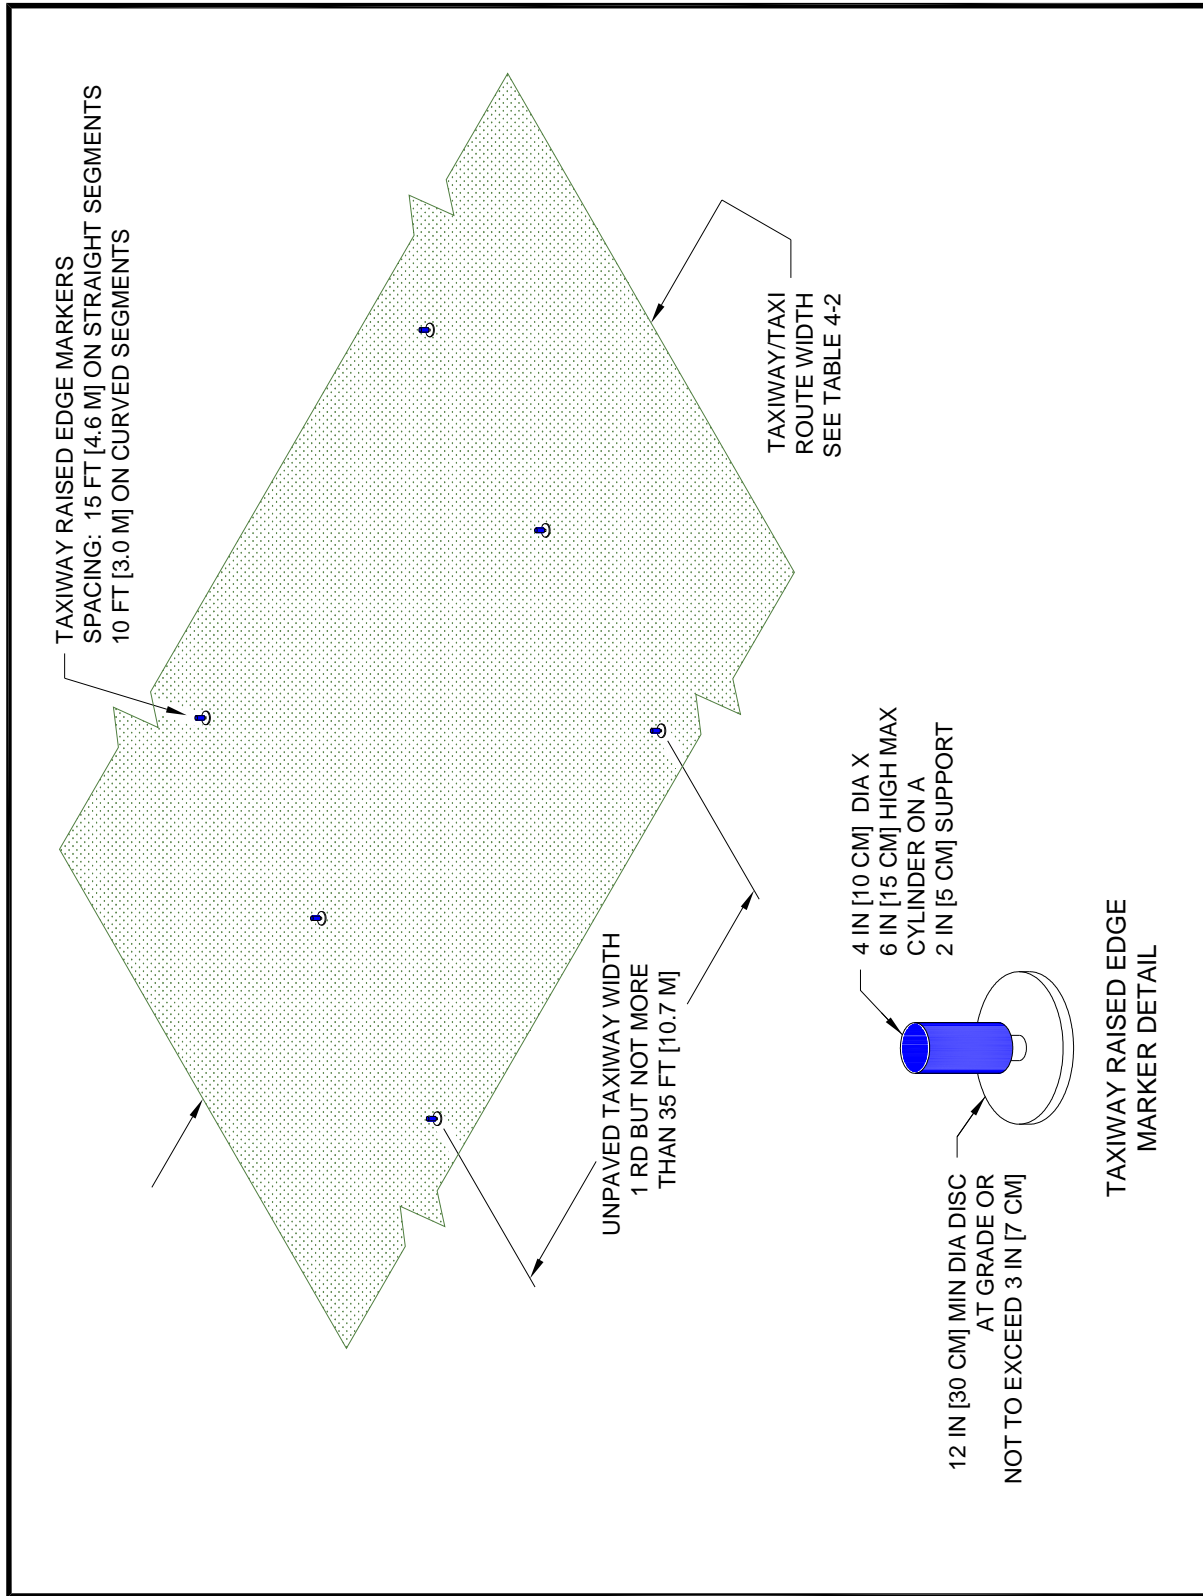

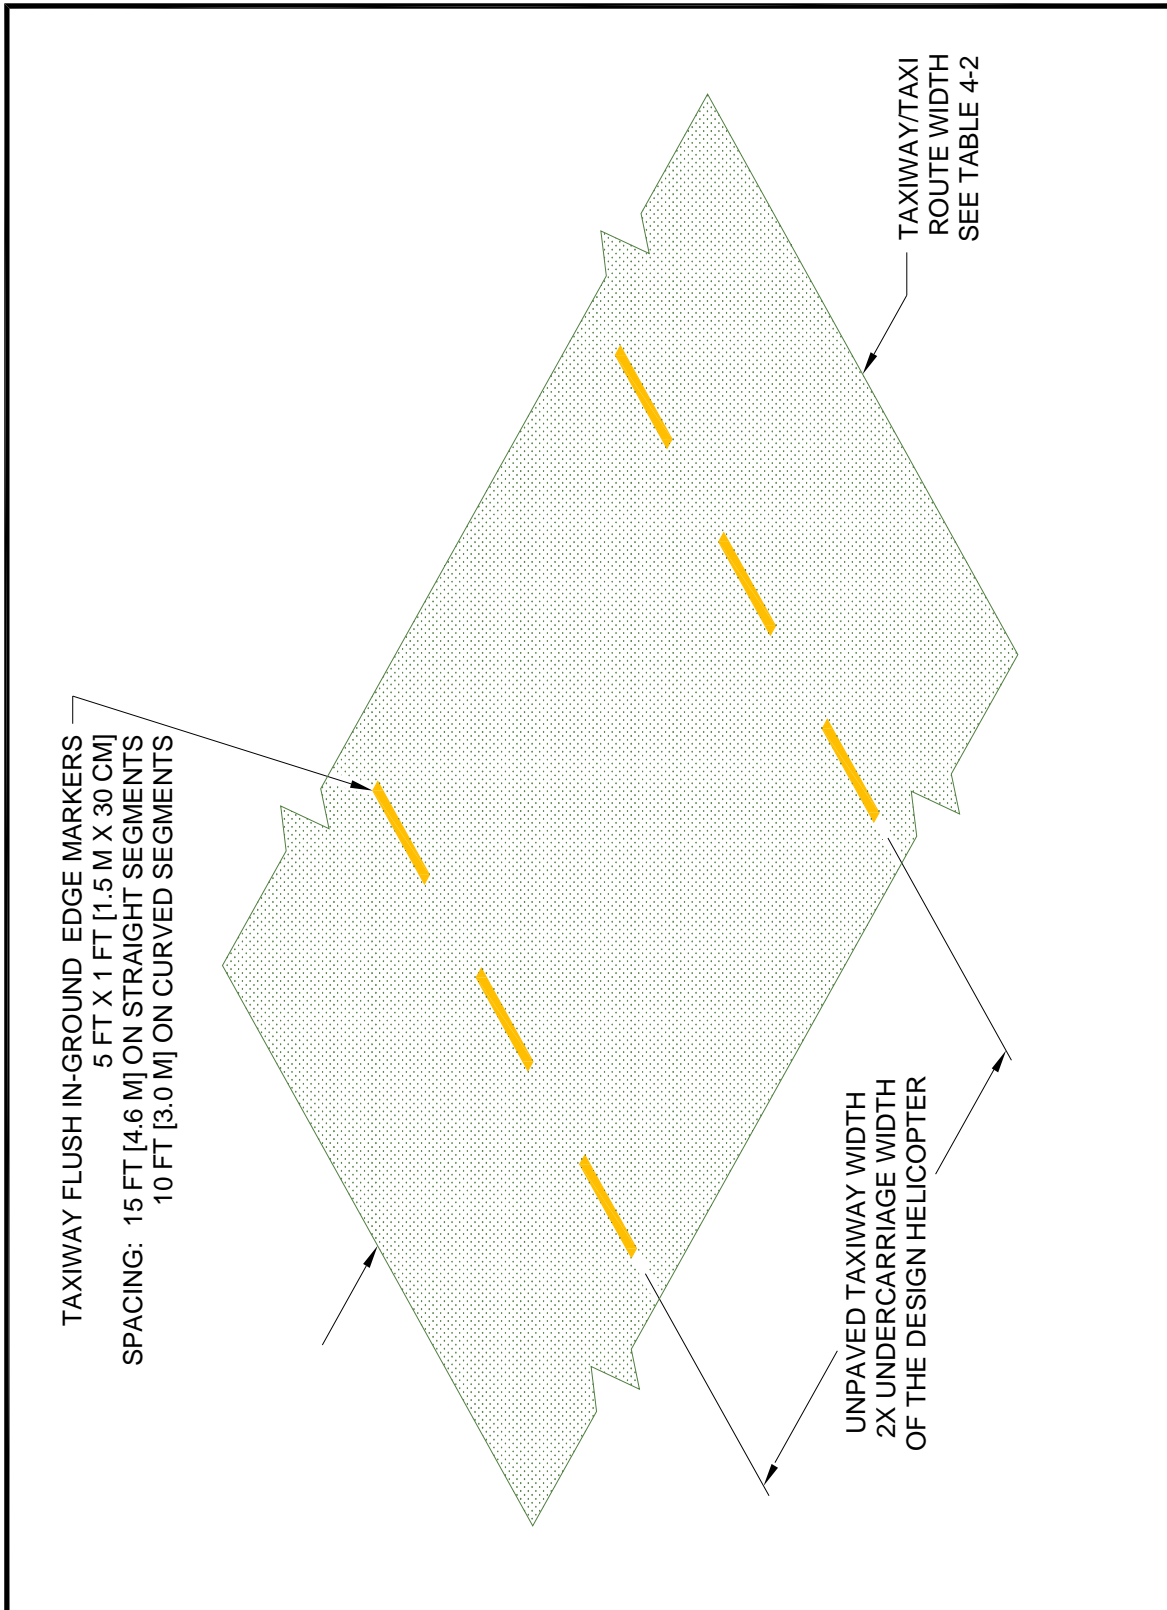

Figure 4-13. Taxiway/Taxi Route Relationship – Unpaved Taxiway with Raised Edge Markers: Hospital

**Figure 4-14. Taxiway/Route Relationship –
Unpaved Taxiway with Flush Edge Markers: Hospital**

Table 4-2. Taxiway / Taxi Route Dimensions – Hospital Heliports

Taxiway (TW) Type	Minimum Width of Paved Area	Centerline Marking Type	TW Edge Marking Type	Lateral Separation Between TW Edge Markings	Total Taxi Route Width
Ground Taxiway	2 x UC	Painted	Painted	2 x UC	1½ RD
			Elevated	1 RD but not greater than 35 ft (10.7 m)	
	Unpaved but stabilized for ground taxi	None	Flush	2 x UC	
			Elevated	1 RD but not greater than 35 ft (10.7 m)	
Hover Taxiway	2 x UC	Painted	Painted	2 x UC	2 RD
	Unpaved	None	Elevated or Flush	1 RD but not greater than 35 ft (10.7 m)	

RD: rotor diameter of the design helicopter
 TW: taxiway
 UC: undercarriage length or width (whichever is greater) of the design helicopter

413. Helicopter parking. If more than one helicopter at a time is expected at a heliport, design the facility with an area designated for parking helicopters. The size of this area depends on the number and size of specific helicopters to be accommodated. It is not necessary that every parking position accommodate the design helicopter. Design individual parking positions to accommodate the helicopter size and weight expected to use the parking position at the facility. However, use the design helicopter to determine the separation between parking positions and taxi routes. Use the larger helicopter to determine the separation between parking positions intended for helicopters of different sizes. Design the parking positions to support the static loads of the helicopter intended to use the parking area. Design parking areas as one large, paved apron or as individual, paved parking positions. Ground taxi turns of wheeled helicopters are significantly larger than a hover turn. Consider the turn radius of helicopters when designing taxi intersections and parking positions for wheeled helicopters. Design heliport parking areas so helicopters will be parked in an orientation that keeps the “avoid areas” around the tail rotors (see Figure 4–18, Figure 4–19, and Figure 4–20) clear of passenger walkways.

a. Location. Do not locate aircraft parking areas under an approach/departure surface. However, as an option, allow aircraft parking areas under the transitional surfaces.

(1) For “turn around” parking positions, locate the parking position to provide a minimum distance between the tail rotor arc and any object, building, safety area, or other parking position. The minimum distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or 1/3 RD for hover taxi operations. See Figure 4–15 and Figure 4–18.

(2) For “taxi-through” and “back-out” parking positions, locate the parking position to provide a minimum distance between the main rotor circle and any object, building, safety area, or other parking position. The minimum distance is 10 feet (3 m) for ground taxi operations and the greater of 10 feet (3 m) or 1/3 RD for hover taxi operations. See Figure 4–15, Figure 4–17, and Figure 4–19.

(3) Locate the parking position to provide a minimum distance between the main rotor circle and the edge of any taxi route. Design parking positions such that the helicopter taxis through, turns around, or backs out to depart. The minimum distance is 1/3 RD for “turn around” and “taxi through” parking areas, and 1/2 RD for “back-out” parking areas. See Figure 4–15, Figure 4–16, and Figure 4–17.

b. Parking position sizes are dependent upon the helicopter size. The clearance between parking positions are dependent upon the type of taxi operations (ground taxi or hover taxi) and the intended paths for maneuvering in and out of the parking position. The more demanding requirement will dictate what is required at a particular site. Usually, the parking area requirements for skid-equipped helicopters will be

the most demanding. However, when the largest helicopter is a very large, wheeled aircraft (for example, the S-61), and the skid-equipped helicopters are all much smaller, the parking requirements for wheeled helicopters may be the most demanding. If wheel-equipped helicopters taxi with wheels not touching the surface, design parking areas based on hover taxi operations rather than ground taxi operations.

(1) If all parking positions are the same size, design them to be large enough to accommodate the largest helicopter that will park at the heliport.

(2) When there is more than one parking position, as an option design the facility with parking positions of various sizes and at least one position to accommodate the largest helicopter that will park at the heliport. Design other parking positions to be smaller, designed for the size of the individual or range of individual helicopters parking at that position. Figure 4–20 also provides guidance on parking position identification, size, and weight limitations.

(3) “Taxi-through” parking positions are illustrated in Figure 4–15. When using this design for parking positions, the heliport owner and operator take steps to ensure all pilots are informed that “turn-around” or “back-up” departures from the parking position are not permitted.

(4) “Turn-around” parking positions are illustrated in Figure 4–17.

(5) “Back-out” parking positions are illustrated in Figure 4–17. When using this design for parking positions, design the adjacent taxiway to accommodate hover taxi operations so the width of the taxiway will be adequate to support “back-out” operations.

c. Parking pads. When partially paving a parking area, design the smallest dimension of the paved parking pad to be a minimum of two times the maximum dimension (length or width, whichever is greater) of the undercarriage or the RD, whichever is less, of the largest helicopter that will use this parking position. Place the parking pad in the center of the parking position circle.

d. Walkways. At parking positions, provide marked walkways where practicable. Design the pavement to drain away from walkways.

e. Fueling. Design the facility to allow fueling with the use of a fuel truck or a specific fueling area with stationary fuel tanks.

(1) Various federal, state, and local requirements for petroleum handling facilities apply to systems for storing and dispensing fuel. Find guidance in AC 150/5230-4, Aircraft Fuel Storage, Handling, and Dispensing on Airports. Additional information may be found in various National Fire Protection Association (NFPA) publications. For more reference material, see Appendix D.

(2) Do not locate fueling equipment in the TLOF, FATO, or safety area. Design and mark separate fueling locations to minimize the potential for helicopters to collide with the dispensing equipment. Design fueling areas so there is no object tall enough to be hit by the main or tail rotor blades within a distance of RD from the center point of the position where the helicopter would be fueled (providing $\frac{1}{2}$ RD clearance from the rotor tips). If this is not practical at an existing facility, install long fuel hoses.

(3) **Lighting.** Light the fueling area if night fueling operations are contemplated. Ensure any light poles do not constitute an obstruction hazard.

f. Tiedowns. Install recessed tiedowns to accommodate extended or overnight parking of based or transient helicopters. If tiedowns are provided, recess them so as not to be a hazard to helicopters. Ensure any depression associated with the tiedowns is of a diameter not greater than $\frac{1}{2}$ the width of the smallest helicopter landing wheel or landing skid anticipated to be operated on the heliport surface. In addition, provide storage for tiedown chocks, chains, cables and ropes off the heliport surface to avoid fouling landing gear. Find guidance on recessed tiedowns in AC 20-35, Tiedown Sense.

Figure 4-19. "Taxi-through" and "Back-out" Helicopter Parking Position Marking: Hospital

Figure 4–20. Parking Position Identification, Size, and Weight Limitations: General Aviation

414. Heliport markers and markings. Markers and/or surface markings identify the facility as a heliport. Use paint or preformed material for surface markings (see AC 150/5370-10, Item P-620, for specifications for paint and preformed material). Reflective paint and reflective markers may also be used, though overuse of reflective material can be blinding to a pilot using landing lights. As an option, outline lines/markings with a 6-inch wide (15 cm) line of a contrasting color to enhance conspicuity. Place markings that define the edges of a TLOF, FATO, taxiway or apron within the limits of those areas. Use the following markers and markings:

a. Hospital heliport identification marking. The identification marking identifies the location as a hospital heliport, marks the TLOF and provides visual cues to the pilot.

(1) Standard hospital heliport identification symbol. Mark the TLOF with a red “H” in a white cross. The minimum height of the “H” is 10 feet (3 m). Locate the “H” in the center of the TLOF and orient it on the axis of the preferred approach/departure path. Place a 12-inch wide red bar under the “H” when it is necessary to distinguish the preferred approach/departure direction. The proportions and layout of the standard hospital heliport identification symbol are illustrated in Figure 4–21. Increase the dimensions of the “H” and cross proportionately for larger TLOFs.

(2) Alternative marking. As an alternative to the standard marking, use a red “H” with a white 6-inch (15 cm) wide border within a red cross with a 12 inch (30 cm) wide white border and a surrounding red TLOF. Where it is impractical to paint the whole TLOF red, paint the TLOF so the minimum dimension (length, width, or diameter) of the outer red area is equal to the RD of the design helicopter but not less than 40 feet (12.2 m). Figure 4–22 illustrates this alternative marking. Increase the dimensions of the “H” and cross proportionately for larger TLOFs.

(3) Winter operations. In winter weather at a heliport with a dark TLOF surface, the marking in Figure 4–22 will absorb more heat from the sun and more readily melt residual ice and snow. In contrast, the white area in Figure 4–21 is more likely to be icy during winter weather. Consequently, in areas that experience ice and snow, use the markings in Figure 4–22 for unheated TLOFs.

b. TLOF markings.

(1) TLOF perimeter marking. Mark the TLOF perimeter with markers and/or lines. See paragraph 408 and Table 4-1 for guidance on increasing the size of the safety area if the TLOF perimeter is not marked.

(a) Paved TLOFs. Define the perimeter of a paved or hard surfaced TLOF with a continuous, 12-inch-wide (30 cm), white line. See Figure 4–23.

(b) Unpaved TLOFs. Define the perimeter of an unpaved TLOF with a series of 12-inch-wide (30 cm), flush, in-ground markers, each approximately 5 feet (1.5 m) in length with end-to-end spacing of not more than 6 inches (15 cm). See Figure 4–24.

(2) Touchdown/positioning circle (TDPC) marking. Use an optional TDPC marking to provide guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot’s seat is over the marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2}$ D and a line width of 18 inches (46 cm). Locate a TDPC marking in the center of a TLOF. See Figure 4–21, Figure 4–22, and Figure 4–23.

Figure 4–21. Standard Hospital Heliport Identification Symbols: Hospital

Figure 4–22. Alternative Hospital Heliport Identification Symbols: Hospital

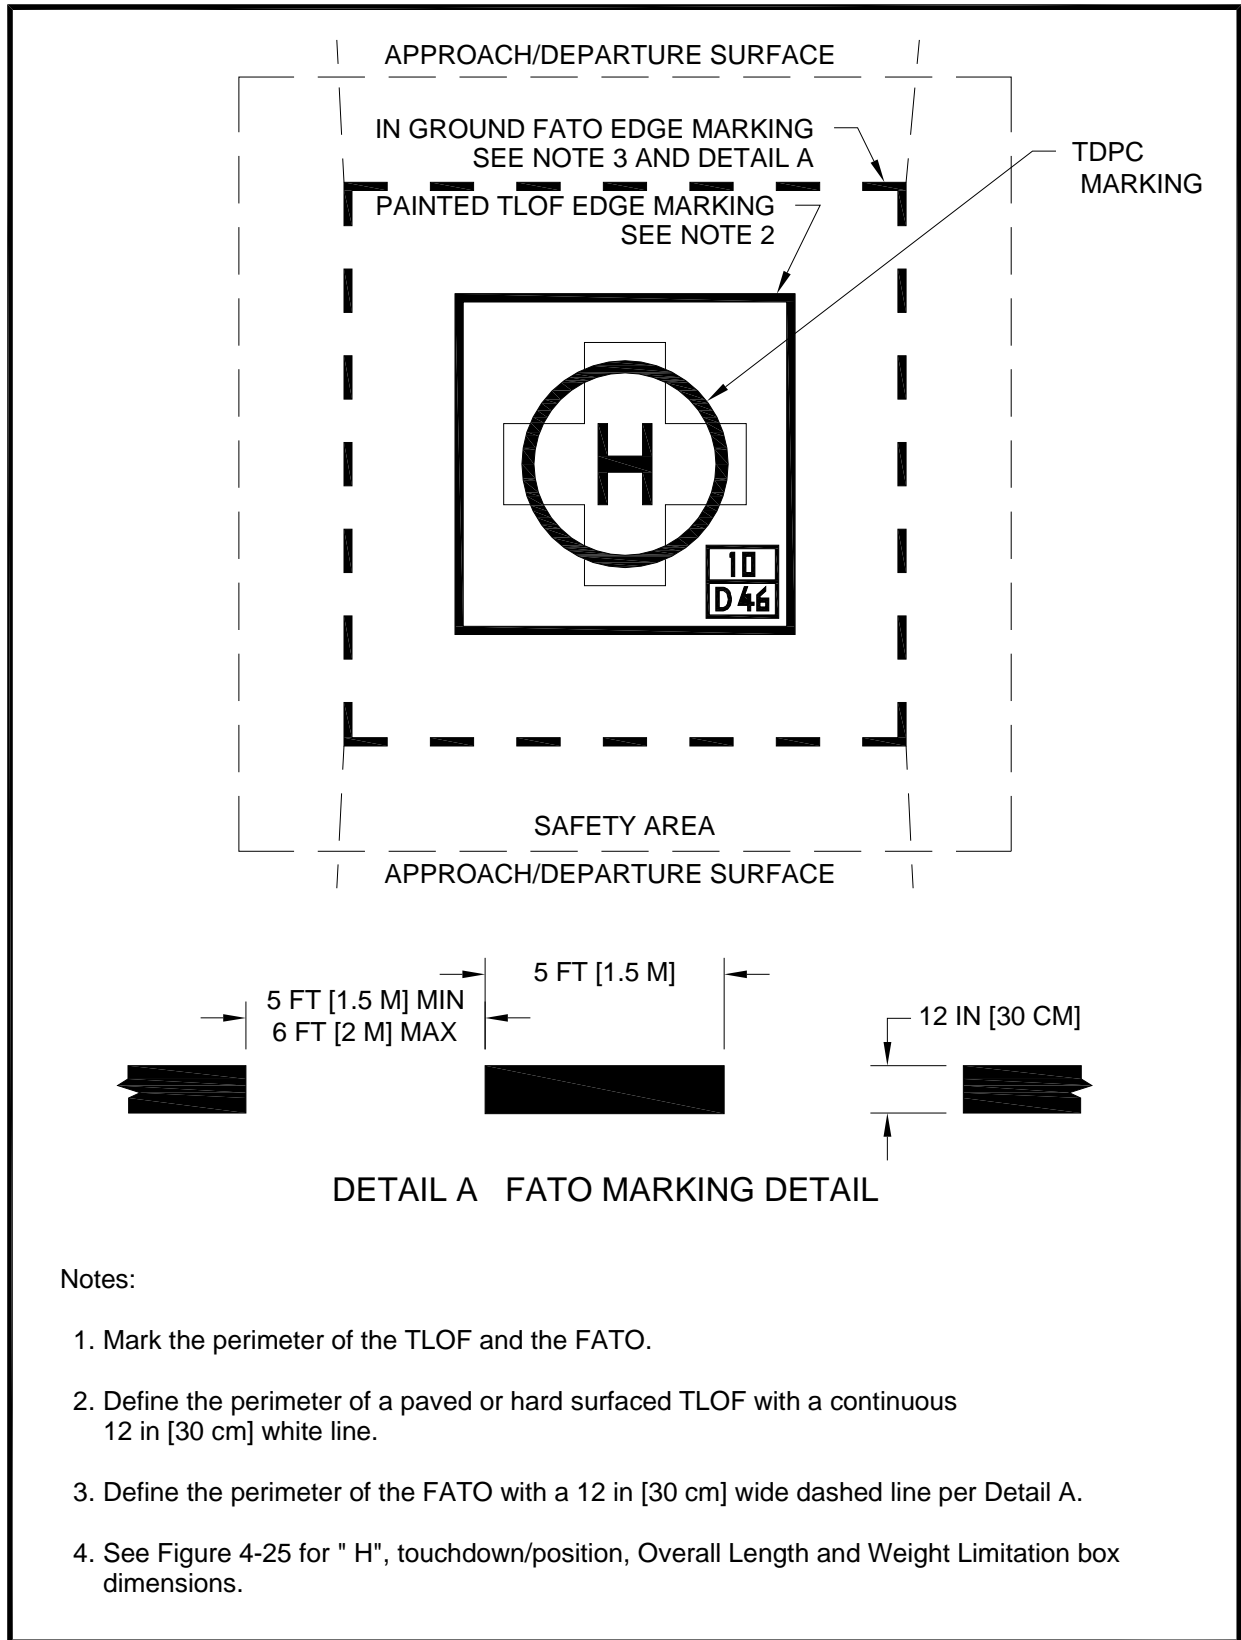

Figure 4-23. Paved TLOF/Paved FATO – Paved TLOF/Unpaved FATO – Marking: Hospital

Figure 4-24. Unpaved TLOF/Unpaved FATO – Marking: Hospital

(3) TLOF size and weight limitations. Mark the TLOF to indicate the length and weight of the largest helicopter it will accommodate, as shown in Figure 4–25. Place these markings in a box in the lower right-hand corner of the TLOF, or on the right-hand side of the “H” of a circular TLOF, when viewed from the preferred approach direction. The box is 5 feet (1.5 m) square. The numbers are 18” (46 cm) high. If necessary, interrupt the TDPC marking with this marking. (See Figure C–2.) The numbers are black with a white background. This marking is optional at a TLOF with a turf surface.

(a) TLOF size limitation. This number is the length (D) of the largest helicopter the TLOF will accommodate, as shown in Figure 4–25. The marking consists of the letter “D” followed by the dimension in feet. Do not use metric equivalents used for this purpose. Center this marking in the lower section of the TLOF size/weight limitation box.

(b) TLOF weight limitations. If a TLOF has limited weight-carrying capability, mark it with the maximum takeoff weight of the design helicopter, in units of thousands of pounds, as shown in Figure 4–25. Do not use metric equivalents for this purpose. Center this marking in the upper section of a TLOF size/weight limitation box. If the TLOF does not have a weight limit, add a diagonal line extending from the lower left hand corner to the upper right hand corner to the upper section of the TLOF size/weight limitation box.

c. Extended pavement/structure markings. As an option at hospital heliports, increase the pavement or structure without a corresponding increase in the length and width or diameter of the FATO to accommodate pedestrians and/or support operations. Whether or not this increased area is part of the LBA, mark the pavement or structure outside the TLOF with 12-inch-wide (30 cm) diagonal black and white stripes. See Figure 4–26 for marking details.

d. FATO markings.

(1) FATO perimeter marking. Define the perimeter of a load-bearing FATO with markers and/or lines. Do not mark the FATO perimeter if any portion of the FATO is not a load-bearing surface. In such cases, mark the TLOF perimeter (see paragraph 414.)

(a) Paved FATO. Define the perimeter of a paved load-bearing FATO with a 12-inch-wide (30 cm) dashed white line. Use marking segments approximately 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m) to define the corners of the FATO and the perimeter. See Figure 4–23.

(b) Unpaved FATO. Define the perimeter of an unpaved load-bearing FATO with 12-inch-wide (30 cm), flush, in-ground markers. Use marking segments approximately 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m) to define the corners of the FATO and the perimeter. See Figure 4–23 and Figure 4–24.

e. Flight path alignment guidance marking. An optional flight path alignment guidance marking consists of one or more arrows to indicate the preferred approach/departure direction(s). Place it on the TLOF, FATO and/or safety area surface as shown in Figure 4–10. The shaft of the arrow(s) is 18 inches (50 cm) in width and at least 10 feet (3 m) in length. When combined with a flight path alignment guidance lighting system described in paragraph 415, it takes the form shown in Figure 4–10, which includes scheme for marking the arrowheads. Use a color that provides good contrast against the background color of the surface on which they are marked. An arrow pointing toward the center of the TLOF depicts an approach direction. An arrow pointing away from the center of the TLOF depicts a departure direction. In the case of a flight path limited to a single approach direction or a single takeoff direction, the arrow marking is unidirectional. In the case of a heliport with only a bidirectional approach/takeoff flight path available, the arrow marking is bidirectional.

Figure 4-25. TLOF Size and Weight Limitations: Hospital

Figure 4–26. Extended Pavement or Structure Marking: Hospital

f. Taxi route and taxiway markings.

(1) Paved taxiway markings. Mark the centerline of a paved taxiway with a continuous 6-inch (15 cm) yellow line. If necessary to increase conspicuity, mark both edges of the paved portion of the taxiway with two continuous 6-inch (15 cm) wide yellow lines spaced 6 inches (15 cm) apart. Figure 4–12 illustrates taxiway centerline and edge markings.

(2) Unpaved taxiway markings. Use either raised or in-ground flush edge markers to provide strong visual cues to pilots. Space them longitudinally at approximately 15-foot (5 m) intervals on straight segments and at approximately 10-foot (3 m) intervals on curved segments. Figure 4–13 and Figure 4–14 illustrate taxiway edge markings.

(a) Raised-edge markers are blue, 4 inches (10 cm) in diameter, and 10 inches (25 cm) high, as illustrated in Figure 4–13.

(b) In-ground, flush edge markers are yellow, 12 inches (30 cm) wide, and approximately 5 feet (1.5 m) long.

(3) Raised edge markers in grassy areas. Raised edge markers are sometimes obscured by tall grass. Address this issue with 12-inch (30 cm) diameter concrete pads or solid material disks around the poles supporting the raised markers.

(4) Taxiway to parking position transition requirements. For paved taxiways and parking areas, taxiway centerline markings continue into parking positions and become the parking position centerlines.

g. Parking position markings. If a hospital heliport has a parking position, the following standards apply.

(1) Paved parking position identifications. Mark parking position identifications (numbers or letters) if there is more than one parking position. These markings are yellow characters 36 inches (91 cm) high. See Figure 4–20 and Figure C–1.

(2) Rotor diameter circle. Define the circle of the RD of the largest helicopter that will park at that position with a 6-inch (15 cm) wide, solid yellow line with an outside diameter of RD. In paved areas, this is a painted line (See Figure 4–20). In unpaved areas, use a series of flush markers, 6 inches (15 cm) in width, a maximum of 5 feet (1.5 m) in length, and with end-to-end spacing of approximately 5 feet (1.5 m).

h. Touchdown/positioning circle (TDPC) marking. An optional TDPC marking provides guidance to allow a pilot to touch down in a specific position on paved surfaces. When the pilot's seat is over the marking, the undercarriage will be inside the LBA, and all parts of the helicopter will be clear of any obstacle by a safe margin. A TDPC marking is a yellow circle with an inner diameter of $\frac{1}{2} D$ and a line width of 18 in (46 cm). Locate a TDPC marking in the center of a parking area. Use a TDPC marking for "turn-around" parking areas. See Figure 4–20 and Figure 4–18.

i. Maximum length marking. On paved surfaces, indicate the D of the largest helicopter that the position is designed to accommodate (for example, 40) with this marking. This marking consists of yellow characters at least 36 inches (91 cm) high. See Figure 4–20 and Figure C–1.

j. Parking position weight limit. If a paved parking position has a weight limitation, mark it in units of 1,000 lbs as illustrated in Figure 4–20. (A 4 indicates a weight-carrying capability of up to 4,000 lbs. Do not use metric equivalents for this purpose.) This marking consists of yellow characters 36 inches (91 cm) high. Place a bar under the number if necessary to minimize the possibility of being misread. See Figure 4–18 and Figure C–1.

k. Shoulder line markings. Use optional shoulder line markings for paved parking areas (See Figure 4–15) to ensure safe rotor clearance. Locate a 6-inch (15 cm) wide solid yellow shoulder line,

perpendicular to the centerline and extending to the RD marking, so it is under the pilot's shoulder such that the main rotor of the largest helicopter for which the position is designed will be entirely within the rotor diameter parking circle (See Figure 4–20.) Use 0.25 D from the center of parking area to define the location of shoulder line. Use a shoulder line marking for “taxi through” and “back-out” parking areas.

l. Walkways. Figure 4–20 illustrates one marking scheme.

m. Closed heliport. Obliterate all markings of a permanently closed heliport, FATO, or TLOF. If it is impractical to obliterate markings, place a yellow “X” over the “H”, as illustrated in Figure 4–27. Use a yellow “X” large enough to ensure early pilot recognition that the heliport is closed. Remove the wind cone(s) and other visual indications of an active heliport.

n. Marking sizes. See Appendix C for guidance on the proportions of painted numbers.

Figure 4–27. Marking a Closed Heliport: Hospital

415. Heliport lighting. If the heliport operator intends for the facility to support night operations, light the heliport with FATO and/or TLOF perimeter lights as described below. Design flush light fixtures and installation methods to support point loads of the design helicopter transmitted through a skid or wheel.

a. TLOF perimeter lights.

(1) Ground level TLOF. Use green lights meeting the requirements of FAA Airports Engineering Brief 87, Heliport Perimeter Light for Visual Meteorological Conditions (VMC), to define the TLOF perimeter. If only the TLOF is load bearing, use flush lights or, as a less desirable option, raised green omnidirectional lights. Use a minimum of three light fixtures per side of a square or rectangular TLOF. Locate a light at each corner, with additional lights uniformly spaced between the

corner lights. Using an odd number of lights on each side will place lights along the centerline of the approach. To define a circular TLOF, use an even number of lights, with a minimum of eight, uniformly spaced. Space the lights at a maximum of 25 feet (7.6 m). Locate flush lights within 1 foot (30 cm) (inside or outside) of the TLOF perimeter. Locate raised lights outside and within 10 feet (3 m) of the edge of the TLOF. Make sure raised lights do not penetrate a horizontal plane at the TLOF elevation by more than 2 inches (5 cm). Figure 4–28 and Figure 4–30 illustrate these lights.

(2) Elevated TLOF. As an option, use raised, omnidirectional lights meeting the requirements of EB 87, located on the outside edge of the TLOF or the outer of the safety net, as shown in Figure 4–29. Lighting on the outer edge of the safety net provides better visual cues to pilots at a distance from the heliport since it outlines a larger area. Make sure raised lights do not penetrate a horizontal plane at the TLOF elevation by more than 2 inches (5 cm).

b. Load-bearing FATO perimeter lights. Use green lights meeting the requirements of EB 87 to define the perimeter of a load bearing FATO. Do not light the FATO perimeter if any portion of the FATO is not a load-bearing surface. Use a minimum of three flush or raised light fixtures per side of a square or rectangular FATO. Locate a light is located at each corner, with additional lights uniformly spaced between the corner lights. Using an odd number of lights on each side will place lights along the centerline of the approach. To define a circular FATO, use an even number of lights, with a minimum of eight, uniformly spaced. Space lights at a maximum of 25 feet (7.6 m). Locate flush lights within 1 foot (30 cm) (inside or outside) of the FATO perimeter (see Figure 4–28 and Figure 4–30). As an option, use a rectangular light pattern even if the TLOF is circular. At a distance during nighttime operations, a square or rectangular pattern of FATO perimeter lights provides the pilot with better visual alignment cues than a circular pattern, but a circular pattern may be more effective in an urban environment. In the case of an elevated FATO with a safety net, mount the perimeter lights in a similar manner as discussed in paragraph 415. Make sure raised FATO perimeter lights are no more than 8 inches (20 cm) high, and locate them 10 feet (3 m) from the FATO perimeter.

c. Floodlights. The FAA has not evaluated floodlights for effectiveness in visual acquisition of a heliport. However, if ambient light does not adequately illuminate markings for night operations, use floodlights to illuminate the TLOF, the FATO, and/or the parking area. If possible, mount these floodlights on adjacent buildings to eliminate the need for tall poles. Take care, however, to place floodlights clear of the TLOF, the FATO, the safety area, and the approach/departure surfaces, and transitional surfaces. Ensure floodlights and their associated hardware do not constitute an obstruction hazard. Aim floodlights down to provide adequate illumination on the surface. Make sure floodlights that might interfere with pilot vision during takeoff and landings are capable of being turned off by pilot control or at pilot request.

Figure 4–28. Flush TLOF/FATO Perimeter Lighting: Hospital

Figure 4-29. Elevated TLOF, Safety Net and Lighting Heliport Partial Elevation: Hospital

Figure 4-30. Flush TLOF and Raised FATO Perimeter Lighting: Hospital

d. Landing direction lights. As an option when it is necessary to provide directional guidance, install landing direction lights. Landing direction lights are a configuration of five green omnidirectional lights meeting the standards of EB 87, on the centerline of the preferred approach/departure path. Space these lights at 15-foot (5 m) intervals beginning at a point not less than 20 feet (6 m) and not more than 60 feet (18 m) from the TLOF perimeter and extending outward in the direction of the preferred approach/departure path, as illustrated in Figure 4–31.

e. Flight path alignment lights. Flight path alignment lights meeting the requirements of EB 87 are optional. Place them in a straight line along the direction of approach and/or departure flight paths. If necessary, extend them across the TLOF, FATO, safety area or any suitable surface in the immediate vicinity of the FATO or safety area. Install three or more green lights spaced at 5 feet (1.5 m) to 10 feet (3.0 m). See Figure 4–10.

f. Taxiway and taxi route lighting.

(1) Taxiway centerline lights. Define taxiway centerlines with flush bidirectional green lights meeting the standards of AC 150/5345-46, Specification for Runway and Taxiway Light Fixtures, for type L-852A (straight segments) or L-852B (curved segments). Space these lights at maximum 50-foot (15 m) longitudinal intervals on straight segments and at maximum 25 foot (7.6 m) intervals on curved segments, with a minimum of four lights needed to define the curve. Uniformly offset taxiway centerline lights no more than two feet (0.6 m) if necessary to ease painting the taxiway centerline. As an option, use green retroreflective markers meeting requirements for Type I markers in AC 150/5345-39, Specification for L-853, Runway and Taxiway Retroreflective Markers in lieu of the L-852A or L-852B lighting fixtures.

(2) Taxiway edge lights. Use omnidirectional blue lights to light the edges of a taxiway. As an option, use blue retroreflective markers to identify the edges of the taxiway in lieu of lights. Make sure retroreflective markers are no more than 8 inches (20 cm) tall.

(a) Straight segments. Space lights at 50 feet (15.2 m) longitudinal intervals on straight segments.

(b) Curved segments. Curved taxiway edges require shorter spacing of edge lights. Determine the spacing based on the radius of the curve. The applicable spacing for curves is shown in AC 150/5340-30, Design and Installation Detail for Airport Visual Aids. Space the taxiway edge lights uniformly. Use at least three edge lights for curved edges of more than 30 degrees from point of tangency (PT) of the taxiway section to PT of the intersecting surface. For radii not listed in AC 150/5340-30, determine spacing by linear interpolation.

(c) Paved taxiways. Use flush lights meeting the standards of AC 150/5345-46 for type L-852T.

(d) Unpaved taxiways. Use raised lights meeting the standards of AC 150/5345-46 for type L-861T. Use a maximum lateral spacing for the lights or reflectors equal to the RD of the design helicopter, but not more than 35 feet (10.7 m).

Figure 4-31. Landing Direction Lights: Hospital

g. Helicopter identification beacon. A helicopter identification beacon is optional equipment. It is the most effective means to aid the pilot in visually locating the helicopter. Locate the beacon, flashing white/green/yellow at the rate of 30 to 45 flashes per minute, on or close to the helicopter. Find guidance on helicopter beacons in AC 150/5345-12, Specification for Airport and Helicopter Beacon. As an option, allow the beacon to be pilot controllable, so it is “on” only when needed.

416. Marking and lighting of difficult-to-see objects. It is often difficult for pilot to see unmarked wires, antennas, poles, cell towers, and similar objects, even in the best daylight weather, in time to take evasive action. While pilots can avoid such objects during en route operations by flying well above them, approaches and departures require operations near the ground where obstacles may be a factor. This paragraph discusses the marking and lighting of objects near, but outside and below the approach/departure surface. Find guidance on marking and lighting objects in AC 70/7460-1, Obstruction Marking and Lighting.

a. Airspace. If difficult-to-see objects penetrate the object identification surfaces illustrated in Figure 4-32 and Figure 4-33, mark these objects to make them more conspicuous. If a helicopter supports operations between dusk and dawn, light these difficult-to-see objects. Guidance on marking and lighting objects is contained in AC 70/7460-1. The object identification surfaces in Figure 4-32 and Figure 4-33 can also be described as follows:

(1) In all directions from the safety area, except under the approach/departure paths, the object identification surface starts at the safety area perimeter and extends out horizontally for a distance of 100 feet (30.5 m).

(2) Under the approach/departure surface, the object identification surface starts from the outside edge of the FATO and extends horizontally out along the approach path for a distance of 800 feet (244 m). From this point, the object identification surface extends out along the approach path for an additional distance of 3,200 feet (975 m) while rising on an 8:1 slope (8 units horizontal in 1 unit vertical). From the point 800 feet (244 m) from the FATO perimeter, the object identification surface is 100 feet (30.5 m) beneath the approach/departure surface.

(3) The width of the safety surface increases as a function of distance from the safety area. From the safety area perimeter, the object identification surface extends laterally to a point 100 feet (30.5 m) outside the safety area perimeter. At the upper end of the surface, the object identification surface extends laterally 200 feet (61 m) on either side of the approach/departure path.

b. Shielding of objects. Title 14 CFR part 77.9, Construction or alteration requiring notice, provides that if there are a number of objects close together, it may not be necessary to mark all of them if they are shielded. To meet the shielding guidelines part 77 requires that an object “be shielded by existing structures of a permanent and substantial nature or by natural terrain or topographic features of equal or greater height, and will be located in the congested area of a city, town, or settlement where the shielded structure will not adversely affect safety in air navigation.”

c. Equipment/object marking. Make helicopter maintenance and servicing equipment, as well as other objects used in the airside operational areas, conspicuous with paint, reflective paint, reflective tape, or other reflective markings. Find additional guidance in AC 150/5210-5, Painting, Marking, and Lighting of Vehicles Used on an Airport.

Figure 4-32. Airspace Where Marking and Lighting are Recommended: Hospital

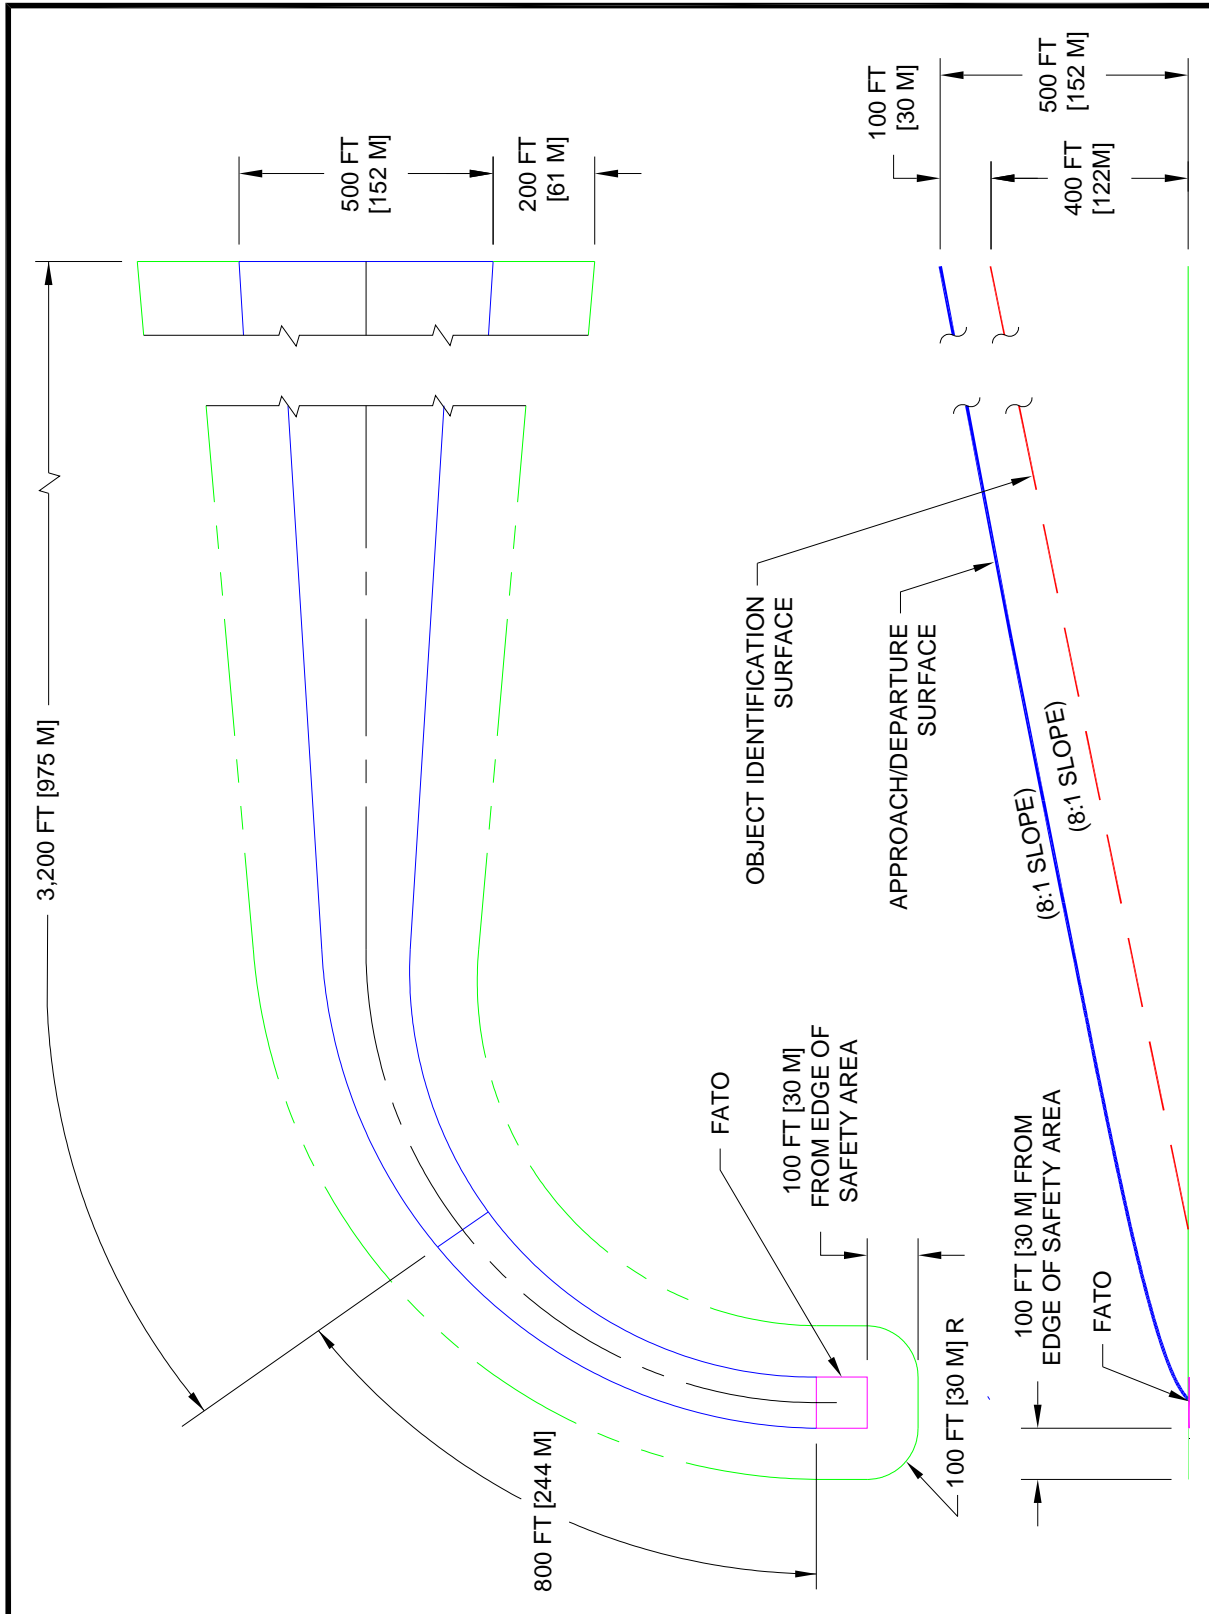

Figure 4-33. Airspace Where Marking and Lighting are Recommended:
Curved Approach: Hospital

417. Safety considerations. Consider the safety enhancements discussed below in the design of a heliport. Address other areas such as the effects of rotor downwash based on site conditions and the design helicopter.

a. Security. Provide a means to keep the operational areas of a hospital heliport clear of people, animals, and vehicles. Use a method to control access depending upon the helicopter location and types of potential intruders.

(1) Safety barrier. At ground-level hospital heliports, erect a safety barrier around the helicopter operational areas in the form of a fence or a wall. Construct the barrier no closer to the operation areas than the outer perimeter of the safety area. Make sure the barrier does not penetrate any approach/departure (primary or transitional) surface. If necessary in the vicinity of the approach/departure paths, install the barrier well outside the outer perimeter of the safety area.

(2) Make sure any barrier is high enough to present a positive deterrent to persons inadvertently entering an operational area and yet low enough to be non-hazardous to helicopter operations.

(3) Access. Control access to airside areas in a manner commensurate with the barrier (for example, build fences with locked gates). Display a cautionary sign similar to that illustrated in Figure 4-34 on gates and doors. As an option at hospital heliport, secure operational areas via the use of security guards and a mixture of fixed and movable barriers.

b. Rescue and fire-fighting services. Heliports are subject to state and local rescue and fire-fighting regulations. Provide a fire hose cabinet or extinguisher at each access gate/door and each fueling location. Locate fire hose cabinets, fire extinguishers, and other fire-fighting equipment near, but below the level of, the TLOF. Find additional information in various NFPA publications. For more reference material, see Appendix D.

c. Communications. Use a Common Traffic Advisory Frequency (CTAF) radio to provide arriving helicopters with heliport and traffic advisory information but do not use this radio to control air traffic. Contact the Federal Communications Commission (FCC) for information on CTAF licensing.

d. Weather information. An automated weather observing system (AWOS) measures and automatically broadcasts current weather conditions at the heliport site. When installing an AWOS, locate it at least 100 feet (30 m) and not more than 700 feet (213 m) from the TLOF and such that its instruments will not be affected by rotor wash from helicopter operations. Find guidance on AWOS systems in AC 150/5220-16, Automated Weather Observing Systems (AWOS) for Non-Federal Applications, and FAA Order 6560.20, Siting Criteria for Automated Weather Observing Systems (AWOS). Other weather observing systems will have different siting criteria.

e. Winter operations. Swirling snow raised by a helicopter's rotor wash can cause the pilot to lose sight of the intended landing point and/or hide objects that need to be avoided. Design the heliport to accommodate the methods and equipment used for snow removal. Design the heliport to allow the snow to be removed sufficiently so it will not present an obstruction hazard to the tail rotor, main rotor, or undercarriage. Find guidance on winter operations in AC 150/5200-30, Airport Winter Safety and Operations.

Figure 4-34. Caution Sign: Hospital

418. Visual glideslope indicators (VGSI). A VGSI provides pilots with visual vertical course and descent cues. Install the VGSI such that the lowest on-course visual signal provides a minimum of 1 degree of clearance over any object that lies within 10 degrees of the approach course centerline.

a. Siting. The optimum location of a VGSI is on the extended centerline of the approach path at a distance that brings the helicopter to a hover with the undercarriage between 3 and 8 feet (0.9 to 2.5 m) above the TLOF. Figure 4–35 illustrates VGSI clearance criteria. To properly locate the VGSI, estimate the vertical distance from the undercarriage to the pilot’s eye.

b. Control of the VGSI. As an option, allow the VGSI to be pilot controllable such that it is “on” only when required.

c. VGSI needed. A VGSI is an optional feature. However, provide a VGSI if one or more of the following conditions exist, especially at night:

(1) Obstacle clearance, noise abatement, or traffic control procedures require a particular slope to be flown.

(2) The environment of the heliport provides few visual surface cues.

d. Additional guidance. AC 150/5345-52, Generic Visual Glideslope Indicators (GVGI), and AC 150/5345-28, Precision Approach Path Indicator (PAPI) Systems, provide additional guidance.

419. Zoning and compatible land use. Where state and local statutes permit, the FAA encourages a hospital heliport operator to promote the adoption of the following zoning measures to ensure the heliport will continue to be available and to protect the investment in the facility.

a. Zoning to limit building/object heights. Find general guidance on drafting an ordinance that would limit building and object heights in AC 150/5190-4, A Model Zoning Ordinance to Limit Height of Objects Around Airports. Substitute the heliport surfaces for the airport surfaces in the model ordinance.

b. Zoning for compatible land use. The FAA encourages public agencies to enact zoning ordinances to control the use of property within the HPZ and the approach/departure path environment, restricting activities to those compatible with helicopter operations.

e. Air rights and property easements. Use air rights and property easements as options to prevent the encroachment of obstacles in the vicinity of a heliport.

Figure 4-35. Visual Glideslope Indicator Siting and Clearance Criteria: Hospital

Chapter 5. Helicopter Facilities on Airports

501. General. Helicopters are able to operate on most airports without unduly interfering with airplane traffic. If necessary, provide separate facilities and approach/departure procedures when the volume of airplane and/or helicopter traffic affects operations. At airports with interconnecting passenger traffic, provide gates at the terminal for helicopter boarding. People who use a helicopter to go to an airport generally require convenient access to the airport terminal and the services provided to airplane passengers. Identify the location of the exclusive-use helicopter facilities, TLOFs, FATOs, safety areas, approach/departure paths, and helicopter taxi routes and taxiways on the airport layout plan (ALP). This chapter addresses design considerations for providing separate helicopter facilities on airports. Figure 5-1 shows an example of a heliport located on an airport. Other potential heliport locations are on the roofs of passenger terminals or parking garages serving passenger terminals.

502. Applicability. The standards in this chapter apply to projects funded under the Airport Improvement Program (AIP) or Passenger Facility Charge (PFC) program. For other projects/heliports, these standards are the FAA's recommendations for designing all heliports on airports. The design standards in this chapter assume there will never be more than one helicopter within the final approach and takeoff area (FATO) and the associated safety area. If there is a need for more than one touchdown and lift-off area (TLOF) at a heliport, locate each TLOF within its own FATO and within its own safety area. Unless otherwise noted, the standards in Chapter 2 apply to helicopter facilities serving general aviation operations and the standards in Chapter 3 apply to helicopter facilities serving transport operations.

503. Touchdown and liftoff area (TLOF). Locate the TLOF to provide ready access to the airport terminal or to the helicopter user's origin or destination.

504. Final approach and takeoff area (FATO). Table 5-1 provides standards for the distance between the centerline of an approach to a runway and the centerline of an approach to a FATO for simultaneous, same direction, VFR operations.

Table 5-1. Recommended Distance between FATO Center to Runway Centerline for VFR Operations

Airplane Size	Small Helicopter 7,000 lbs or less	Medium Helicopter 7,001 to 12,500 lbs	Large Helicopter over 12,500 lbs
Small Airplane 12,500 lbs or less	300 feet (91 m)	500 feet (152 m)	700 feet (213 m)
Large Airplane 12,500 lbs to 300,000 lbs	500 feet (152 m)	500 feet (152 m)	700 feet (213 m)
Heavy Airplane Over 300,000 lbs	700 feet (213 m)	700 feet (213 m)	700 feet (213 m)

505. Safety area. Apply the safety area dimensions and clearances described in Chapter 2 to facilities being developed on an airport for general aviation helicopter use. Apply safety area dimensions and clearances in Chapter 3 to facilities being developed on an airport for transport helicopter use.

506. VFR approach/departure paths. To the extent practical, design helicopter approach/departure paths to be independent of approaches to and departures from active runways.

507. Heliport protection zone (HPZ). Establish an HPZ where it is practicable for the airport owner to acquire and plan the land uses within the HPZ. Where this is not practicable, the HPZ standards have recommendation status for that portion of the HPZ the airport owner does not control.

508. Taxiways and taxi routes. When developing exclusive helicopter taxiways or taxi routes at an airport, locate them to minimize interaction with airplane operations.

509. Helicopter parking. Locate helicopter parking positions as close to the intended destination or origination of the passengers as conditions and safety permit.

510. Security. Unless screening was carried out at the helicopter passengers' departure location, Transportation Security Administration regulations may require that a screening area and/or screening be provided before passengers enter the airport's secured areas. If necessary, establish multiple helicopter parking positions and/or locations in the terminal area to service helicopter passenger screening and/or cargo interconnecting needs. Find information about passenger at the Transportation Security Administration web site <http://www.tsa.gov/public/>.

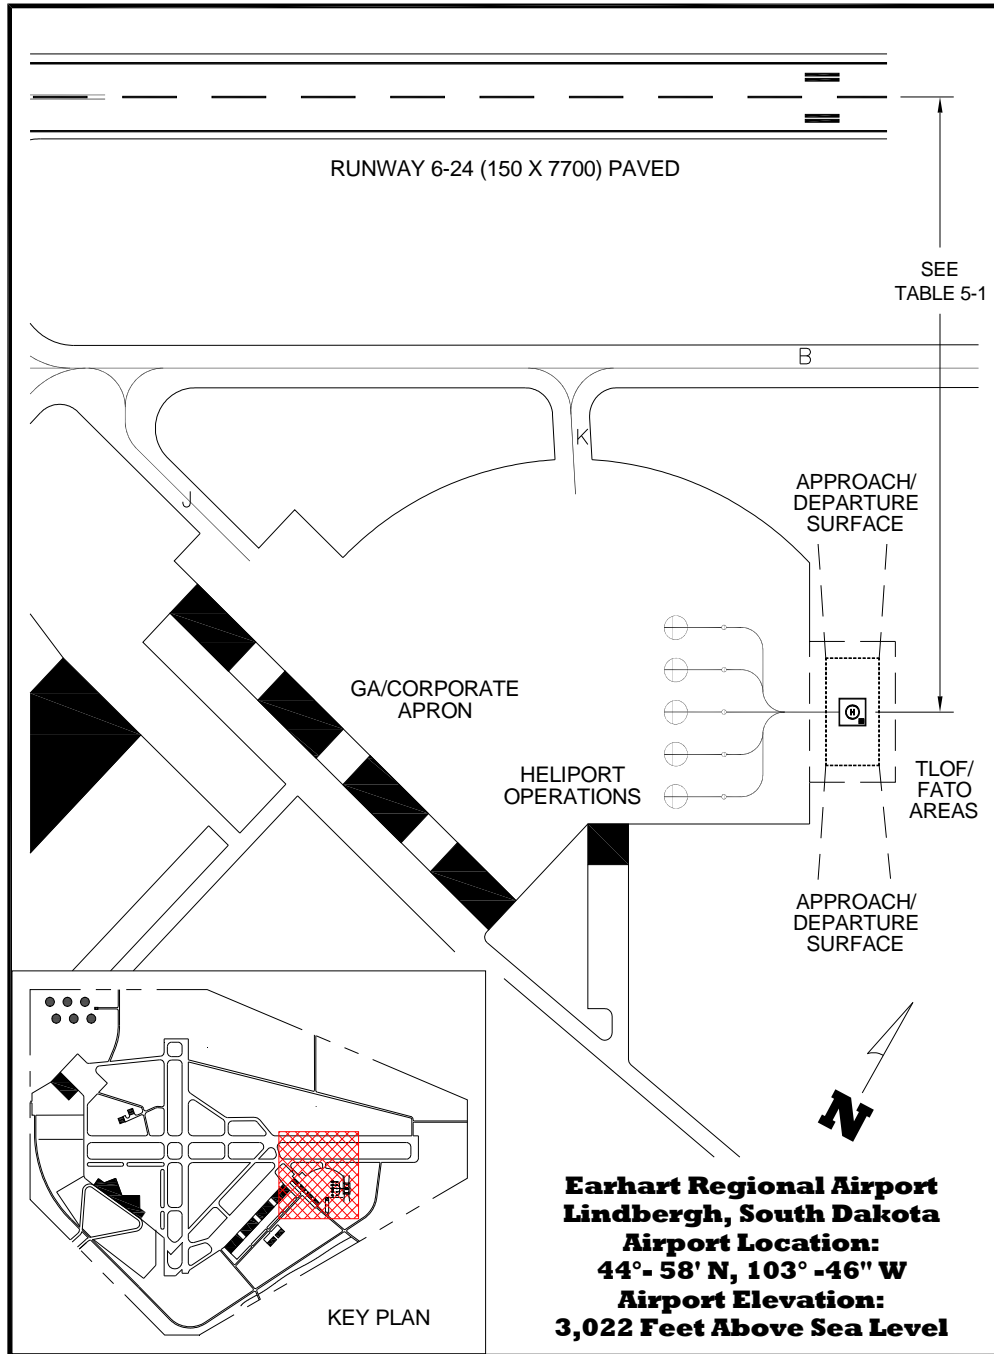

Figure 5-1. Heliport Located on an Airport: On Airport

Intentionally Left Blank

Chapter 6. Instrument Operations

601. General. Instrument approach/departure/missed approach procedures permit helicopter operations to continue during periods of low cloud ceilings and reduced visibility. The FAA establishes Instrument approach procedures in accordance with FAA 8260 series Orders published by FAA Flight Procedures Standards Branch. When a heliport does not meet the criteria of this AC, or FAA 8260 Series Orders, the FAA publishes the helicopter instrument approach procedure as a SPECIAL procedure, with annotations that special aircrew qualifications, pilot training and aircraft equipment are required to fly the specific procedure(s).

602. Planning. This chapter addresses issues that heliport owners consider before requesting the development of instrument approach/departure/missed approach procedures. The standards and recommendations in this AC are not intended to be sufficient to design an instrument procedure. Initiate early contact with the appropriate FAA Flight Standards Office to establish instrument procedures.

603. Airspace. Those who design instrument approach/departure/missed approach procedures have some flexibility in the design of such procedures. For this and other reasons, the airspace required to support helicopter instrument approach/departure operations is complex, and it does not lend itself to simple descriptions, even using figures. Refer to the latest revision of FAA 8260-series orders for more detailed information on criteria for developing helicopter instrument approach/departure/missed approach procedures.

604. Final approach reference area (FARA). For precision instrument procedures only, a certificated helicopter precision approach procedure terminates with the helicopter coming to a hover or touching down within a 150-foot-wide (45 m) by at least 150-foot long (45 m) FARA. The FARA is located at the far end of a 300-foot-wide by 1,225-foot-long (91 m by 373 m) FATO required for a precision instrument procedure. For the purposes of requirements for LBA and lighting, substitute the FARA for the FATO. Figure 6-1 illustrates the FARA/FATO relationship.

605. Improved lighting system. Installing the lighting systems described below may result in lower visibility minimums. See Figure 6-2 and Figure 6-3.

a. FATO perimeter lighting enhancement. Insert an additional raised, green light meeting the standards of FAA Airports Engineering Brief 87, Heliport Perimeter Light for Visual Meteorological Conditions (VMC), between each light in the front and rear rows of the raised perimeter lights to enhance the definition of the FATO.

b. Heliport instrument lighting system. The HILS consists of 24 unidirectional PAR 56, 200-watt white lights that extend the FATO perimeter lights. The system extends both the right and left edge lights as “edge bars” and both the front and rear edge lights as “wing bars,” as shown in Figure 6-2.

(1) Edge bars. Place edge bar lights at 50-foot (15.2 m) intervals, measured from the front and rear row of the FATO perimeter lights.

(2) Wing bars. Space wing bar lights at 15-foot (4.57 m) intervals, measured from the line of FATO perimeter (side) lights.

(3) Optional TLOF lights. A line of seven white flush lights meeting the standards of EB 87 is optional. Space them at 5-foot (1.5 m) intervals in the TLOF pavement. Align these lights on the centerline of the approach course to provide close-in directional guidance and improve TLOF surface definition. These lights are illustrated in Figure 6-2.

c. **Helicopter approach lighting System (HALS).** The HALS, depicted in Figure 6–3 is a distinctive approach lighting configuration designed to prevent it from being mistaken for an airport runway approach lighting system.

606. Obstacle evaluation surfaces. The instrument procedure developer considers the specific heliport location, its physical characteristics, the terrain, surrounding obstructions, and so on, in designing the helicopter instrument approach procedure. Upon development of the instrument procedure, protect its underlying obstacle evaluation surfaces from penetrations. See paragraph 221. Also see paragraphs 201.e, 301.e, and 401.e.

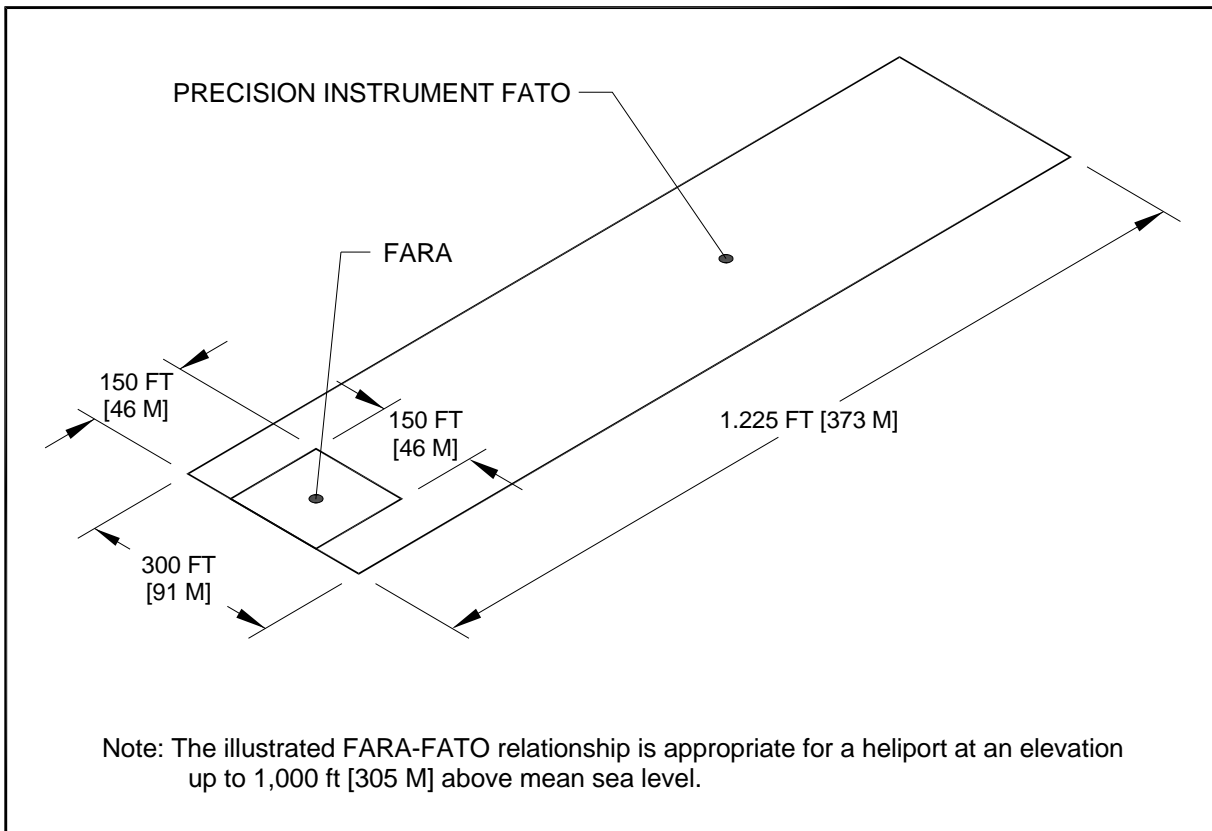

Figure 6–1. FARA/FATO Relationship: Precision

Figure 6–2. Heliport Instrument Lighting System (HILS): Non-precision

- Notes:
1. The depicted HALS is appropriate for a heliport located at an elevation up to 1,000 ft [305 m] above mean sea level.
 2. The depicted HILS has elevated FATO edge lights. Flush FATO edge lights are also an option. Flush FATO edge lights would be placed just inside the FATO.

Figure 6-3. Heliport Approach Lighting System

Chapter 7. Heliport Gradients and Pavement Design

701. General. This chapter provides guidance on designing heliport pavements, including design loads, and addresses soil stabilization as a method of treating non paved operational surfaces. Provide a present a reasonably smooth, uniformly graded surface for operational surfaces such as the TLOF, FATO, safety areas, parking areas, taxi routes, and taxiways. Design the surfaces of a heliport to provide positive drainage.

702. TLOF gradients.

a. General aviation heliport. To ensure drainage, design the TLOF to have a gradient between 0.5 percent and 2 percent.

b. Transport heliport. To ensure drainage, design the TLOF to have a longitudinal gradient between 0.5 and 1 percent and a transverse gradient between 0.5 and 1.5 percent.

c. Hospital heliport. To ensure drainage, design the TLOF to have a gradient between 0.5 and 1 percent and 2 percent.

703. FATO gradients.

a. Load bearing FATO. Design a load bearing FATO to have a gradient between 0.5 percent and 5 percent. Design the gradient to be not more than 2 percent in any areas where a helicopter is expected to land. To ensure TLOF drainage, design gradients of rapid runoff shoulders to be between 3 and 5 percent. These standards are illustrated in Figure 7–1 below for a concrete TLOF and stabilized turf FATO.

b. Non-load bearing FATO. When the FATO is non-load bearing and/or not intended for use by the helicopter, there are no specific requirements for the gradient of the surface. In this case, design the gradient to be 5 percent or more to ensure adequate drainage away from the area of the TLOF. However, stabilize non-load bearing surfaces. See paragraph 707.

704. Safety area gradients. Design the surface of the safety area to be no steeper than a downward slope of 2:1 (2 units horizontal in 1 unit vertical). In addition, make sure the surface of the safety area is not higher than the FATO edge.

705. Parking area gradients. Design all helicopter parking area grades to not exceed 2 percent.

706. Taxiway and taxi route gradients. Design taxiway longitudinal gradients to not exceed 2 percent. Design transverse gradients to be between 0.5 percent and 2 percent.

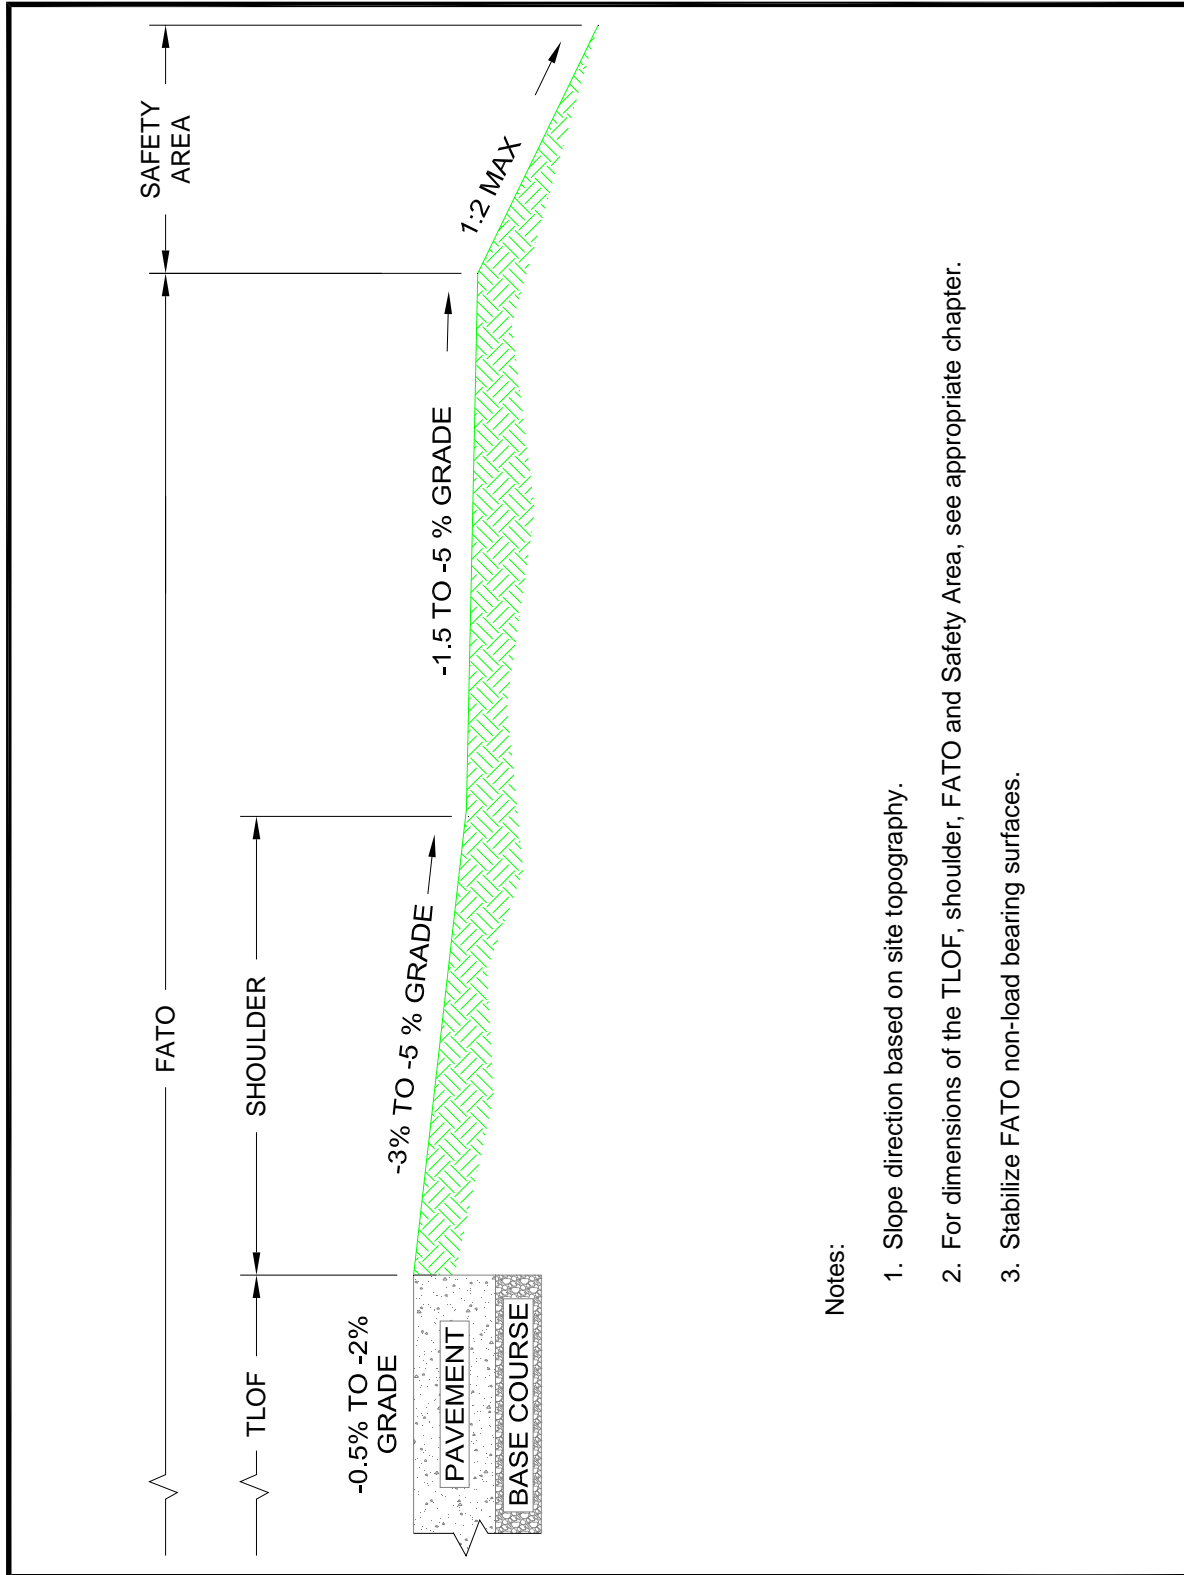

Figure 7-1. Heliport Grades and Rapid Runoff Shoulder: Gradients and Pavement

707. Design loads. Design and construct the TLOF and any load-bearing surfaces to support the weight of the design helicopter and any ground support vehicles. Loads are applied through the contact area of the tires for wheel-equipped helicopters or the contact area of the skid for skid equipped helicopters. Find lists of Helicopter weights, landing gear configurations, and dimensional data in Appendix B.

a. Static loads. For design purposes, the design static load is equal to the helicopter's maximum takeoff weight applied through the total contact area of the wheels or skids. Contact manufacturers to obtain the contact area for the specific helicopters of interest.

b. Dynamic loads. A dynamic load of 0.2 second or less duration may occur during a hard landing. For design purposes, assume dynamic loads at 150 percent of the takeoff weight of the design helicopter. When specific loading data is not available, assume 75 percent of the weight of the design helicopter to be applied equally through the contact area of the rear two rear wheels (or the pair rear wheels of a dual-wheel configuration) of a wheel-equipped helicopter. For a skid equipped helicopter assume 75 percent of the weight of the design helicopter to be applied equally through the aft contact areas of the two skids of a skid-equipped helicopter. (See Figure 7-2.) Contact manufacturers to obtain the aft contact area for specific helicopters of interest.

c. Rotor loads. Rotor downwash loads are approximately equal to the weight of the helicopter distributed uniformly over the disk area of the rotor. Tests have established that rotor downwash loads are generally less than the loads specified in building codes for snow, rain, or wind loads typically used in structural design calculations.

708. Pavement design and soil stabilization. Pavements distribute helicopters' weight over a larger area of the subsurface as well as provide a water-impervious, skid-resistant wearing surface. Pave TLOFs, FATOs, taxiways, and parking aprons to improve their load carrying ability, minimize the erosive effects of rotor wash, and facilitate surface runoff. Stabilize unpaved portions of the FATO and taxi routes subjected to rotor wash. In some instances, loads imposed by ground support vehicles may exceed those of the largest helicopter expected to use the facility. Find guidance on pavement design and on stabilizing soils in AC 150/5320-6, Airport Pavement Design and Evaluation, and AC 150/5370-10, Standards for Specifying Construction of Airports. These ACs are available at the Airports web site (<http://www.faa.gov/airports>).

a. Pavements. In most instances, a 6-inch thick (15 cm) portland cement concrete (PCC) pavement is capable of supporting operations by helicopters weighing up to 20,000 pounds (9,070 kg). Use thicker pavements for heavier helicopters or where the quality of the subsurface soil is questionable. If feasible, use PCC pavement for all surfaces used by helicopters.

b. Stabilizing soils. Use appropriate methods of soil stabilization to meet different site requirements. Consider helicopter weight, ground support vehicle weight, operational frequency, soil analysis, and climatic conditions in selecting the method(s) and extent of surface stabilization.

(1) Turf. A well-drained and well-established turf that presents a smooth, dense surface is usually the most cost-effective surface stabilization available. In some combinations of climates and weather conditions, turf surfaces are capable of supporting the weight of many of the smaller helicopters for low frequency use by private and corporate operators during much of the year. Turf surfaces also provide reasonable protection against wind, rotor wash, or water erosion. Climatic and soil conditions dictate the appropriate grass species to use at the site. Find guidance on turf establishment in AC 150/5370-10.

(2) Aggregate turf. Where heliports are located on soils that have poor load-carrying capabilities when wet, consider overcoming this deficiency by mixing selected granular materials into the upper 12 inches (30 cm) of the soil. Suitable granular materials for this purpose are crushed stone, pit-run

gravel, coarse sand, or oyster shells. Use a sufficient ratio of aggregate to soil to improve the stability of the soil yet retain the soil's ability to support grass. For additional guidance, see Item 217 of AC 150/5370-10.

c. Formed masonry shapes. Precast masonry shapes vary in size and shape—from a brick paver to an open block. Lay pavers on a prepared bed to present a solid surface. Embed precast blocks in the soil with grass growing in the natural openings. Architectural catalogs identify different masonry shapes that are commercially available for this purpose.

d. Pierced metal panels. Lay perforated metal panels that allow grass to grow through the openings on the ground to provide a hard surface for helicopter operations. Engineering catalogs identify commercially available panels.

Figure 7–2. Helicopter Landing Gear Loading: Gradients and Pavement

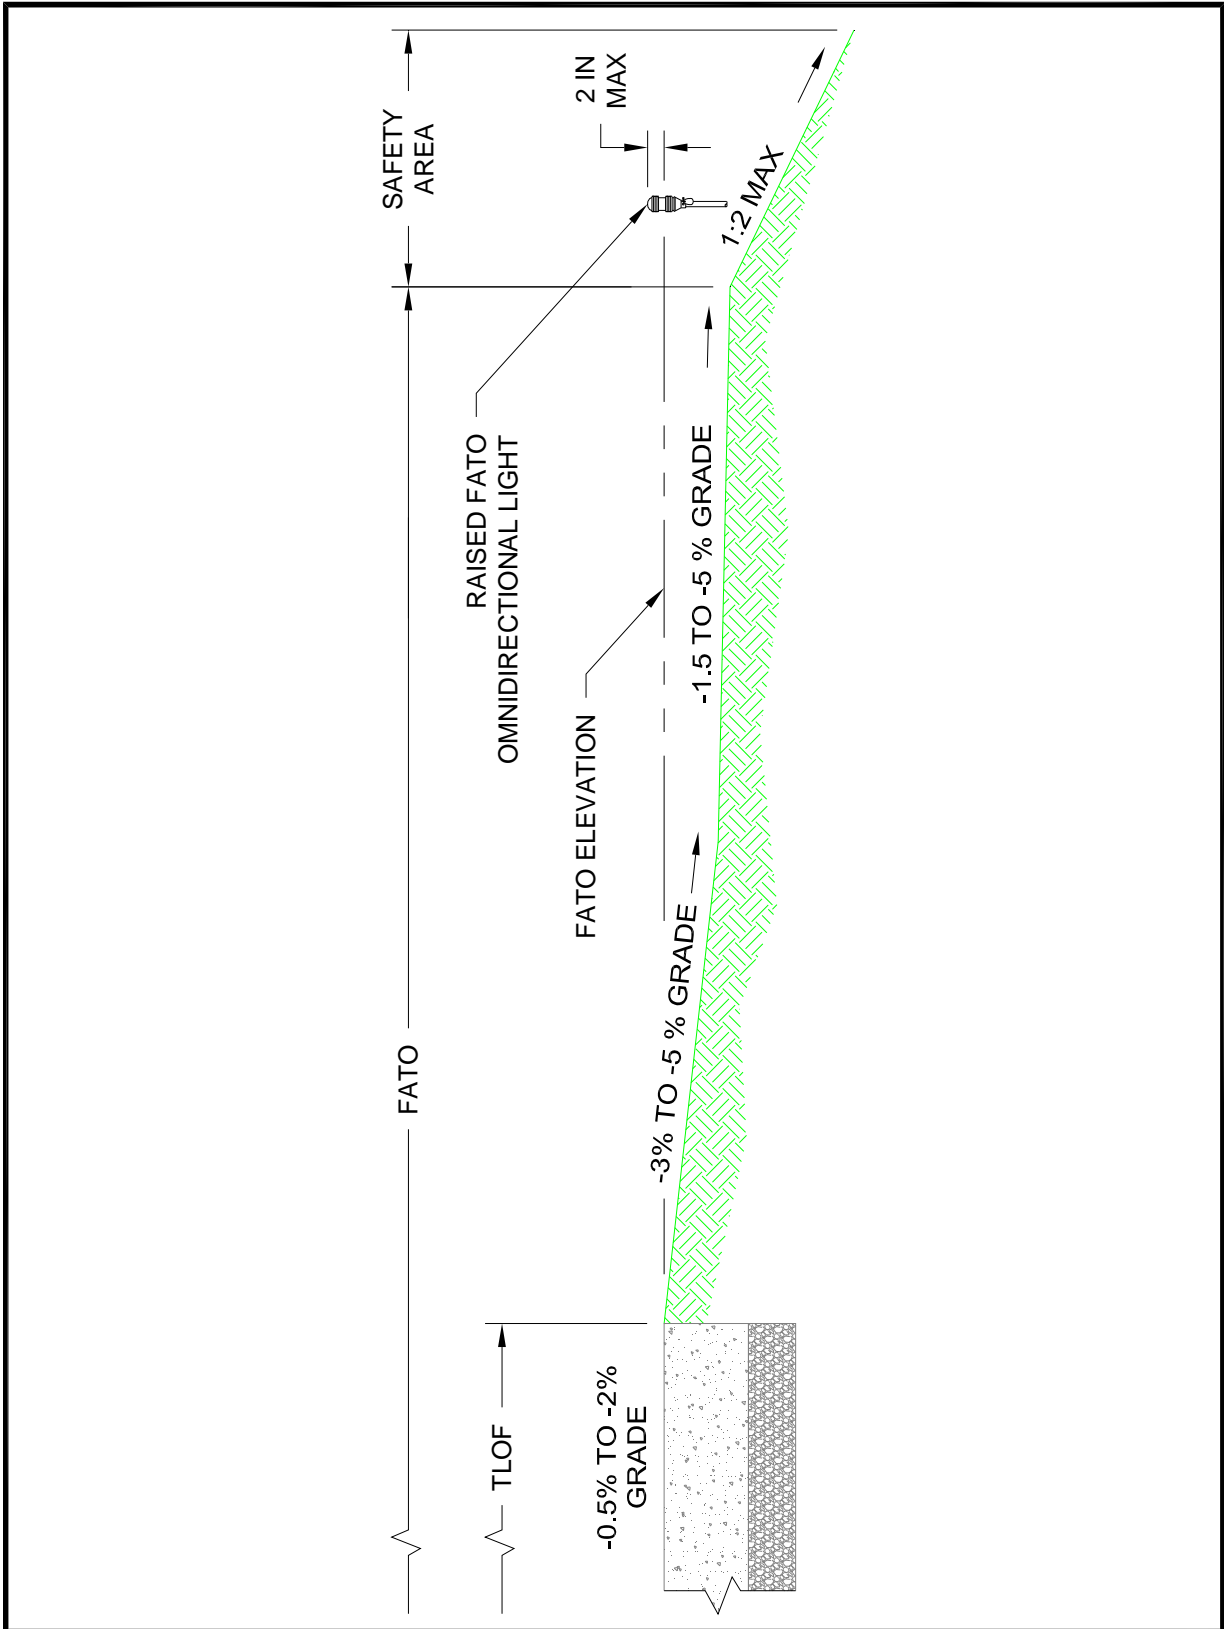

Figure 7-3. FATO Elevation

This page intentionally left blank.

Appendix A. Emergency Helicopter Landing Facilities (EHLF)

A-1. General. Preplanning emergency landing areas will result in safer and more effective air-support operations. These facilities comprise rooftop emergency facilities and medical emergency sites. Use the following as a guide for developing emergency helicopter landing facilities (EHLF).

A-2. Notification and coordination. In addition to any requirements to provide notice under part 157, advise the local Terminal Approach Radar Control or the local Air Traffic Control facility manager in writing of the EHLF.

A-3. Rooftop emergency facilities. Review local building codes to determine if they require structures over a specified height to provide a clear area on the roof capable of accommodating a helicopter to facilitate fire fighting or emergency evacuation operations.

a. Building code requirements. State and local building code requirements apply to rooftop facilities. Develop the landing surface to the local fire department requirements based on the size and weight of the helicopter(s) expected to engage in fire or rescue operations (see Figure A-1). Find additional information in various National Fire Protection Association (NFPA) publications. For more reference material, see Appendix D.

b. TLOF.

(1) Size. Design the TLOF to be square, rectangular or circular in configuration and centered within the EHLF. Design the length and width or diameter to be at least 40 feet (12.2 m)

(2) Weight capacity. Design the TLOF to accept a 13,500-pound gross weight (GW) helicopter plus an impact load of 1.5 times GW.

(3) Access. Provide two pedestrian access points to the TLOF at least 90 degrees apart with a minimum of 60 feet (18 m) TLOF perimeter separation.

(4) Drainage. Design the surface so drainage flows away from pedestrian access points, with a maximum slope of 1.5 percent.

c. FATO. Design the FATO to be at the same level as the TLOF.

(1) Size. Design the FATO to extend a distance of at least 45 feet (13.7 m) in all directions from the center of the EHLF. For safe operation, provide clearance of one third of the rotor diameter (RD) of the largest helicopter expected but not less than 20 feet (6.1 m) between the helicopter's main and tail rotor blades and any object that could be struck by these blades.

(2) Obstructions. As an option, design the FATO to be an imaginary surface outside the TLOF and extending beyond the structure edge. Design the FATO to be unobstructed and without penetration of obstacles such as parapets, window washing equipment, penthouses, handrails, antennas, vents, etc.

d. Safety area. Provide a clear, unobstructed area, a minimum of 12 feet (3.7 m) wide, on all sides, outside and adjacent to the FATO.

e. Safety net. If the platform is elevated 4 feet (1.2 m) or more above its surroundings, Title 29 CFR Part 1910.23 Guarding Floor and Wall Openings and Holes, requires the provision of fall protection. The FAA recommends such protection for all platforms elevated 30 inches (76 cm) or more. However, do not use permanent railings or fences, since they would be safety hazards during helicopter operations. As an option, install a safety net, meeting state and local regulations but not less than 5 feet (1.5 m) wide. Design the safety net to have a load carrying capability of 25 lbs/sq ft (122 kg/sq m). Make sure the net does not project above the level of the TLOF. Fasten both the inside and outside edges of the safety net to a solid structure. Construct nets of materials that are resistant to environmental effects.

f. Markings.

(1) **TLOF perimeter.** Define the limits of the touchdown pad with a solid 12-inch (30 cm) wide red or orange line as illustrated in Figure A-1.

(2) **Touchdown/positioning circle (TDPC) marking.** Center a 12-inch wide red or orange circular marking, 30 feet (9.1 m) in diameter, within the TLOF. Use a contrasting color for the background within the circle.

(3) **Weight capacity.** Mark the TLOF with the maximum takeoff weight of the design helicopter, in units of thousands of pounds (for example, a number “9,” indicating 9,000 lbs GW), with each numeral ten feet in length, centered within the TLOF.

(4) **Markings for pedestrians.** Clearly mark rooftop access paths, EHLF access paths, and assembly zone(s) with surface paint and instructional signage.

g. Access.

(1) **Stairs.** Provide a minimum of two rooftop access stairs, with no less than 150 degrees separation, connecting to the top floor of the structure, with at least one providing access to the structure’s emergency staircase.

(2) **Doors.** Keep penthouse and stairwell rooftop access doors unlocked at all times to provide access to the EHLF. As an option, equip doors with “panic bar” hardware and/or alarm them.

h. Wind cone. Locate a wind cone assembly with an orange wind cone within the line of sight from the EHLF and outside the approach/departure path(s).

i. Lighting. Shield ambient rooftop lighting to avoid affecting the pilot’s vision.

A-4. Medical emergency sites. Medical emergency sites are clear and level areas near the scene of an accident or incident that the local emergency response team designates as the place where the helicopter air ambulance is directed to land in order to transport an injured person to a hospital. Provide such sites in various locations within a jurisdiction to support fast response to medical emergencies and accidents. Pre-designating medical emergency sites provides the opportunity to inspect potential sites in advance and to select sites that have adequate clear approach/departure airspace and adequate clear ground space.

Figure A-1. Rooftop Emergency Landing Facility

This page intentionally left blank.

Appendix B. Helicopter Data

This appendix contains selected helicopter data needed by a heliport designer. These data represent the most critical weight, dimensional, or other data entry for that helicopter model, recognizing that specific versions of the model may weigh less, be smaller in some feature, carry fewer passengers, etc.

Various helicopter manufacturers have provided this information, but confirm data by contacting the manufacturer(s) of the specific helicopter(s) of interest.

Legend

A	Manufacturer name and helicopter model
B	Maximum takeoff weight in pounds.
D	Overall length in feet. (Rotors at their maximum extension.)
H	Overall height in feet. (Usually at tail rotor.)
RD	Rotor diameter in feet.
E	Number of blades.
F	Rotor plane clearance in feet.
TR	Distance from rotor hub to tip of tail rotor in feet.
I	Tail rotor diameter (in feet).
J	Number of tail rotor blades.
K	Tail rotor ground clearance in feet.
L	Type of undercarriage.
UCL	Undercarriage length in feet.
UCW	Undercarriage width in feet. (The distance between the outside edges of the tires or the skids.)
M	Number and type of engines
N	Number of crew and passengers.

Advisory Circular

Subject: Helicopter Air Ambulance
Operations

Date: 3/26/15

AC No: 135-14B

Initiated by: AFS-200

Change:

Helicopters provide a means of transporting people in urgent need of medical assistance. These operations are unique due to the urgent nature of the flight. Each year thousands of patients are transported by helicopter while being attended by medical personnel trained to respond to their needs. Helicopter air ambulances (HAA) are equipped with medical monitoring and support systems to ensure proper care en route.

The HAA industry continues to expand. In response to the dynamic growth of this industry, the Federal Aviation Administration (FAA) has issued this advisory circular (AC) to provide information and guidelines to assist existing HAA operators, other Title 14 of the Code of Federal Regulations (14 CFR) part 135 operators considering becoming an HAA operator and those considering new-startup HAA operations. To address an increase in fatal HAA accidents, the FAA has implemented new operational procedures and additional equipment requirements for HAA operations. The FAA, HAA operators and medical community all play vital roles in applying these changes to ensure safety. Implementing a safety culture will benefit all aspects of HAA operations.

Part 135 subpart L addresses safety improvements for commercial helicopter operations through requirements for equipment, pilot testing, alternate airports and increased weather minimums for all General Aviation (GA) helicopter operations. Many of these requirements also address National Transportation Safety Board (NTSB) safety recommendations directed at improving HAA safety.

A handwritten signature in black ink, appearing to read "John S. Duncan".

John S. Duncan
Director, Flight Standards Service

CHAPTER 1. GENERAL

1-1. PURPOSE.

a. Background. This advisory circular (AC) provides information and guidance material specifically applicable to helicopter air ambulance (HAA) operations. The Federal Aviation Administration (FAA) issued a final rule in 2014: Helicopter Air Ambulance, Commercial Helicopter, and Part 91 Helicopter Operations. The bulk of the 2014 HAA rule package codifies requirements formerly contained in Operations Specification (OpSpec) A021, Helicopter Air Ambulance Operations, and which are now in Title 14 of the Code of Federal Regulations (14 CFR) Part 135 Subpart L, Helicopter Air Ambulance Equipment, Operations, and Training.

b. Phraseology Changes.

(1) The term Emergency Medical Service/Helicopter (EMS/H or HEMS) is obsolete. It is being replaced with HAA because, though a critical life and death medical emergency may exist, air ambulance flights are not operated as an emergency. Pilots and operator management personnel should not make flight decisions based on the condition of the patient, but rather upon the safety of the flight.

(2) Management should discourage the use of the term “mission” to describe flight assignments in operator manuals, training, and risk analysis programs. The emphasis should be on providing air transportation rather than completing a “mission.” The mission concept has been derived from military tactical or combat aviation policies that factor in “acceptable losses,” and may affect the normal commercial civil air transportation go/no-go decisionmaking process.

c. Scope. AC 135-14B supports the 2014 final rule. The information provided in this AC cites the associated regulations and other sources for easy reference. This AC is not mandatory and does not constitute a regulation. Nothing in this AC alters legal requirements for HAA operators to comply with regulations. This AC also refers to recommended practices that are not mandatory and do not reflect regulations and their requirements. When properly followed, these compiled industry best practices can enhance safety and reduce the number of HAA accidents.

1-2. CANCELLATION. AC 135-14A, Emergency Medical Services/Helicopter (EMS/H), dated June 20, 1991, is canceled.

1-3. OBJECTIVE. The primary objective of this AC is to provide information on policy and identify best practices for HAA operations based on multiple sources including the HAA rules published in 2014.

1-4. AUDIENCE. This AC is addressed to existing HAA operators and prospective part 135 certificate holders intending to conduct HAA operations, their employees, employees of associated medical services and public service.

1-5. RELATED 14 CFR PARTS. Title 14 CFR parts 1, 27, 29, 43, 61, 65, 91, 119, 120, 135 and 157.

1-6. DEFINITIONS/ABBREVIATIONS.

a. Accident/Incident Plan/Post-Accident/Incident Plan (AIP/PAIP). Includes emergency response procedures that should be used as a basis for training or for reference in the event of a mishap or other emergency.

b. Advisory Circular (AC).

c. Aeromedical Director. A licensed medical professional associated with a HAA operation, ultimately responsible for patient care during air transport. The Aeromedical Director has no operational control authority or influence over decisionmaking related to conduct of flights.

d. Air Ambulance. An aircraft used in air ambulance operations. The aircraft need not be used exclusively as an air ambulance aircraft, and the equipment need not be permanently installed.

e. Air Ambulance Operations. Air transportation of a person with a health condition that requires medical personnel as determined by a health care provider or transportation of human organs; or holding out to the public as willing to provide air transportation to a person with a health condition that requires medical personnel or transplant organs including, but not limited to, advertising, solicitation, association with a hospital or medical care provider.

f. Air Medical Resource Management (AMRM). A dynamic process including pilots, medical personnel (not limited to those participating in HAA flights), maintenance technicians, operational support personnel and management staff that optimizes human-machine interface and related interpersonal issues, with maximum focus on communication skills and team-building curricula. (Refer to the current edition of AC 00-64, Air Medical Resource Management.)

g. Autorotational Distance. The distance a rotorcraft can travel in autorotation as described by its manufacturer in the approved Rotorcraft Flight Manual (RFM). (Refer to part 135, § 135.168.)

h. Certificate-Holding District Office (CHDO). The FAA Flight Standards Service (AFS) CHDO with responsibility for management of an air carrier's certificate, charged with the overall inspection and surveillance of that certificate holder's operations. (Refer to part 1, § 1.2.)

i. Code of Federal Regulations (CFR).

j. Communications Specialist. An individual trained and qualified by the operator to receive and coordinate one or more of a range of activities, including but not limited to receiving flight requests for HAA operations, communications with medical, first response and other HAA organizations, communications with HAA crews and flight locating. The employment and training of communications specialists has been identified as an HAA industry best practice. (See paragraph 3-2f in this AC.)

k. Crew Resource Management (CRM). The use of all the available resources, information, equipment and people to achieve safe and efficient flight operations; approved CRM training is required for flightcrews in accordance with § 135.330. (Refer also to § 135.330 and the current edition of AC 120-51, Crew Resource Management Training, for more information.)

l. Datalink. A general term referring to a variety of technologies used to transmit and receive wireless electronic data between on-aircraft systems and off-aircraft systems.

m. Extended Overwater Operation. Per § 1.1, with respect to helicopters, an operation over water at a horizontal distance of more than 50 nautical miles (NM) from the nearest shoreline and more than 50 NM from the nearest offshore heliport structure.

n. Flight Following. Active contact with an aircraft throughout all of a flight (including time on the ground), either through voice radio contact with the pilot or through automated flight following systems. Considered a best practice in the HAA industry.

o. Flight Locating. The certificate holder is required by regulation to use flight locating procedures (refer to § 135.79), unless an FAA flight plan is filed and activated. Flight locating by HAA operations, even where it is not required by regulation, is recommended as an HAA industry best practice.

p. Flight Standards District Office (FSDO).

q. General Operations Manual (GOM). Required to be compiled to include, at minimum, sections mandated by regulation, including visual flight rules (VFR) flight planning procedures (§ 135.615) and an FAA approved preflight risk analysis (§ 135.617). A GOM requires acceptance by the FAA to be valid.

r. Geographic Information Systems (GIS). A collection of computer hardware, software and geographic data designed to efficiently capture, store, manage, map, analyze and display geographically referenced information.

s. Helicopter Air Ambulance (HAA). A helicopter, defined for the purposes of § 135.619, that is identified in the operator's OpSpecs. It need not be used exclusively as an HAA. HAA-specific equipment need not be permanently installed.

t. Helicopter Air Ambulance (HAA) Operation. A flight or sequence of flights, with a patient, donor organ or human tissue, or medical personnel on board for the purpose of medical transportation, conducted by a part 135 certificate holder authorized by the Administrator to conduct HAA operations. A HAA operation also includes, but is not limited to:

(1) Flights conducted to position the helicopter at a site where medical personnel, a patient, donor organ or human tissue will be picked up;

(2) Flights conducted to reposition the helicopter after completing transportation of the medical personnel, patient or donor organ or human tissue transport; and

(3) Flights initiated for the transport of a patient, donor organ or human tissue that are terminated due to weather or other reasons. (Refer to § 135.601.)

u. Helicopter Emergency Medical Service (HEMS). Obsolete term. The FAA and industry are moving to the term HAA for enhanced accuracy. HAA flights do not constitute an emergency flight. Replacement of the term HEMS with HAA will take place over the next several years as each relevant document is updated. The term HAA will be used exclusively throughout this document.

v. Helicopter Landing Area (also Heliport or Landing Zone (LZ)). An area of land or water or a structure used or intended to be used for the landing and takeoff of helicopters. OpSpec A021 grants latitude to a helicopter operator for landing site selection as well as the authority to land on appropriate sites during both day and night in HAA operations. (Refer to § 1.1; the current edition of AC 150/5390-2, Heliport Design; and OpSpec A021.)

w. Helicopter Night Vision Goggle Operations (HNVGO). That portion of a flight that occurs during the time period from one hour after sunset to one hour before sunrise where the pilot maintains visual surface reference using night vision goggles (NVG) in an aircraft that is approved for such operations. (Refer to part 61, § 61.1.)

x. Helicopter Terrain Awareness and Warning System (HTAWS). A terrain and obstacle database-driven awareness and warning system configured specifically for a helicopter's operating environment. This system correlates ship's position, altitude, direction of flight and speed with digital obstacle and terrain maps.

y. Inadvertent Instrument Meteorological Condition (IIMC). An emergency condition when an aircraft inadvertently transitions from visual meteorological conditions (VMC) into instrument meteorological conditions (IMC).

z. Instrument Flight Rules (IFR). Operations when weather conditions are below the minimum for flight under VFR.

aa. Instrument Meteorological Conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from clouds and ceiling that are less than that specified for VMC, requiring flight to be conducted under IFR.

bb. Landing Zone (LZ). See subparagraph 1-6v, Helicopter Landing Area.

cc. Local Flying Area (LFA). A geographic area of not more than 50 NM in any direction from a location designated by a HAA operator and approved by the FAA in OpSpec A021. (Refer to § 135.609(b)(1).)

dd. Medical Crewmembers. Also referred to as medical flight personnel, as opposed to flightcrew members. A medical crewmember (medical personnel) is an individual with medical training, carried aboard a HAA during flights or flight segments. Crewmembers typically include: flight nurses, paramedics, respiratory specialists, neonatal specialist and other medically-trained specialists. (Refer to § 135.601(b)(2).)

ee. Mountainous. Designated mountainous areas as listed in 14 CFR part 95. (Refer to § 135.601.)

ff. Night Vision Goggles (NVG). A NVG is a Night Vision Imaging System (NVIS) (q.v.) appliance worn by crewmembers that enhances the ability to maintain visual surface reference under low-light flight conditions.

gg. Night Vision Imaging System (NVIS). An approved light amplification appliance enhancing visual sensitivity in low light conditions, combined with specialized lighting systems that are type certificate (TC) approved for the type of helicopter in which it is installed and are compatible with NVGs being used in that helicopter.

hh. Non-Mountainous. Areas other than mountainous areas as listed in part 95. (Refer to § 135.601.)

ii. Operations Control Center (OCC). An OCC is a centralized, dedicated facility staffed by trained HAA Operations Control Specialist(s) (OCS) (see subparagraph 1-6jj. The OCC is described at § 135.618. OCC review includes a wide range of safety-related items detailed in § 135.619(a).

NOTE: OCCs are required for certificate holders authorized to conduct HAA operations with 10 or more HAA-capable helicopters assigned to their OpSpecs, and are strongly encouraged for all operators. (Refer to § 135.619.)

jj. Operations Control Specialist (OCS). An individual within the OCC who provides operational support for the certificate holder's air ambulance operations and is both initially and recurrently trained as specified in § 135.619(d) and (f). An OCS interfaces with the HAA pilot(s) prior to each flight request acceptance.

kk. Operations Specification (OpSpec). Issued by FAA to specify the commercial air operations it has authorized the certificate holder to carry out. OpSpec A021 authorizes HAA service. Before OpSpec A021 can be issued, the operator must meet the regulatory requirements of part 135 subpart L.

ll. Overwater Flight. Operation of a rotorcraft beyond autorotational distance from the shoreline. (See subparagraph 1-6xx, Shoreline.)

mm. Patient. A person under medical treatment. For the purposes of this definition, human transplant organs or tissue are not patients, but are explicitly included under HAA operations, regulations and practices. They are treated in the same manner as people under medical treatment.

nn. Pilot in Command (PIC). The PIC of an aircraft is directly responsible for and is the final authority as to the operation of that aircraft.

oo. Principal Avionics Inspector (PAI). The PAI at the CHDO specifically responsible for aviation safety inspection and oversight of a HAA operator.

pp. Principal Maintenance Inspector (PMI). The PMI at the CHDO specifically responsible for aviation safety inspection and oversight of a HAA operator.

qq. Principal Operations Inspector (POI). The POI at the CHDO specifically responsible for aviation safety inspection and oversight of a HAA operator.

rr. Residual Risk. Residual risk is the safety risk that exists after all controls have been implemented or exhausted and verified (to ensure that the risk acceptance is in accordance with a pre-existing documented risk analysis procedure.)

ss. Response Scene. Unimproved ad hoc LZ sites and other off-airport and off-heliport site locations where HAA flight landings are authorized under the authority of OpSpec A021.

tt. Risk Analysis. A formal methodology for guiding HAA decisionmaking. Its procedures, principles and policies are documented and are the subject of training by HAA operators. They include multiple people with defined roles that have been documented and are the subject of training. As total risk exceeds the operator's pre-determined threshold, approval at higher levels is required. (Refer to §§ 135.615 and 135.617(a)(5).)

uu. Risk Assessment. Risk assessment is a key element of the broader risk analysis. The two terms assessment and analysis should not be used interchangeably. Process documentation should identify risk factors the HAA operator may consider as part of risk assessment. The operator should assign to each risk factor an appropriate numerical value reflecting both the likelihood of occurrence and severity of outcome. Section 135.617 requires HAA operators to have an FAA approved and documented Risk Analysis Program that includes procedures for elevating the final post mitigation risk to a higher management level for approval when the total risk exceeds a predetermined threshold.

vv. Safety Management System (SMS). A SMS is a formal, top-down approach to managing safety risk. It is a system to manage safety, including the necessary organizational structures, accountabilities, policies and procedures. Implementing a SMS can provide useful tools to the HAA operator for complying with the requirements of § 135.617. Additional information and resources on SMS can be found in the current edition of AC 120-92, Safety Management Systems for Aviation Service Providers, and in Chapter 8 and Appendix B of this AC.

ww. Second in Command (SIC).

xx. Shoreline. Land adjacent to the water of an ocean, sea, lake, pond, river or tidal basin that is above the high-water mark at which a rotorcraft could be landed safely. This does not include land areas unsuitable for landing, such as vertical cliffs or land intermittently under water (refer to § 135.168). Additional information is available in 14 CFR part 136, § 136.1, i.e., "suitable for landing area for helicopters."

yy. Standard Operating Procedures (SOP). An established or prescribed method to be followed routinely for the performance of a designated operation or in a designated situation and is used to guide training to meet such contingencies.

zz. Suitable Offshore Heliport Structure. A heliport structure that can support the size and weight of the rotorcraft being operated where a safe landing can be made.

aaa. Supplemental Type Certificate (STC). A TC issued when an applicant has received approval to modify an aircraft from its original design.

bbb. Visual Flight Rules (VFR).

1-7. RELATED SOURCE MATERIAL. The following lists documents that are applicable to HAA operations.

a. ACs (current editions). ACs can be found on the FAA Web site at http://www.faa.gov/regulations_policies/advisory_circulars.

- AC 00-64, Air Medical Resource Management.
- AC 27-1, Certification of Normal Category Rotorcraft.
- AC 27-1B MG 6, Miscellaneous Guidance (MG) for Emergency Medical Service (EMS) Systems Installations.
- AC 29-2, Certification of Transport Category Rotorcraft.
- AC 91-21.1, Use of Portable Electronic Devices Aboard Aircraft.
- AC 91-32, Safety In and Around Helicopters.
- AC 120-27, Aircraft Weight and Balance Control.
- AC 120-49, Certification of Air Carriers.
- AC 120-51, Crew Resource Management Training.
- AC 120-92, Safety Management Systems (SMS).
- AC 120-96, Integration of Operation Control Centers into Helicopter Emergency Medical Services Operations.
- AC 135-5, Maintenance Program Approval for Carry-On Oxygen Equipment for Medical Purposes.
- AC 150/5390-2, Heliport Design.
- AC 150/5230-4, Aircraft Fuel Storage Handling Training and Dispensing on Airports.

b. Handbooks, Manuals, and Pamphlets (current editions). FAA handbooks can be found on the FAA Web site at http://www.faa.gov/regulations_policies/handbooks_manuals.

- FAA Order 8040.4, Safety Risk Management Policy.
- FAA-H-8083-21, Rotorcraft Flying Handbook.
- FAA-H-8261-1, Instrument Procedures Handbook.
- Airman's Information Manual (AIM).
- DOT/FAA/PM-86/45, Aeronautical Decision Making for Helicopter Pilots.
- DOT/FAA/DS-88/7, Risk Management for Air Ambulance Helicopter Operators.
- FAA FAAS Team Library, Flying in Flat Light and White Out Conditions.
- National EMS Pilots Association (NEMSPA), Preparing a Landing Zone. NEMSPA is located in Layton, UT 84041-9128, telephone (877) 668-0430.

c. Other:

(1) Helicopter Association International (HAI). HAI is located at 1920 Ballenger Avenue, Alexandria, VA 22314-2898, telephone (703) 683-4646. Check their Web site for other documents and links to resources, including their Fly Neighborly Guide.

(2) The National Fire Protection Association (NFPA) is located at 1 Batterymarch Park, Quincy, MA 02169-7471, telephone (617) 770-3000. They have many publications about fire protection. The 400 series may be the most helpful. For example, the current edition of NFPA 418, Standard for Heliports, has fire standards for heliports.

(3) Air Ambulance Guidelines published by both the U.S. Department of Transportation (DOT), National Highway Traffic Administration; and the American Medical Association, Commission on Emergency Medical Services.

(4) The National Association of Air Medical Communications Specialists (NAACS) is located at PO Box 19240, Topeka, KS 66619, telephone (877) 396-2227. Check their Web site for links to resources, including training courses.

(5) Special Airworthiness Information Bulletin (SAIB) SW-10-43, Non-Aviation Transmitters. (Includes, for example, 800 megahertz (MHz) radios used to communicate with hospitals.)

(6) Policy Letter (PL) ASW-2001-01, Certification Guidelines for Compliance to the Requirements for Electro-Magnetic Compatibility (EMC) Testing.

(7) DOT/FAA/AR-99/50, High-Intensity Radiated Fields (HIRF) Risk Analysis.

(8) FAA Technical Standard Order (TSO)-C194, Helicopter Terrain Awareness and Warning System (HTAWS).

(9) International Civil Aviation Organization (ICAO) Doc 9977 AN/489, Manual on Civil Aviation Jet Fuel Supply.

(10) RTCA Inc., DO-160, Environmental Conditions and Test Procedures for Airborne Equipment.

(11) RTCA Inc., DO-178B, Software Considerations in Airborne Systems and Equipment Certification.

(12) RTCA Inc., DO-254, Design Assurance Guidance for Airborne Electronic Hardware.

(13) RTCA Inc., DO-309, Minimum Operational Performance Standards (MOPS) for Helicopter Terrain Awareness and Warning System (HTAWS) Airborne Equipment.

(14) OpSpecs:

- A005, Exemptions and Deviations.
- A008, Operational Control.
- A010, Aviation Weather Information.
- A021, Helicopter Air Ambulance Operations.
- A050, Helicopter Night Vision Goggle Operations (HNVGO).
- A061, Use of Electronic Flight Bag.
- A096, Actual Passenger and Baggage Weight Program for All Aircraft.
- A097, Small Cabin Aircraft Passenger and Baggage Weight Program.
- D085, Aircraft Listing.

1-8. BACKGROUND. This AC focusses on the requirements and challenges faced by HAA operations and how these can be addressed through application of best practices which, when tailored to local and operational requirements and the appropriate scope and complexity of each organization, provide one way of many possible ways to assure safety and compliance with regulatory requirements within a HAA operation.

a. General. The typical HAA operation provides 24-hour local or regional on-call service from an operational base or multiple operational bases. Each base is assigned one or more helicopters and is staffed by one or more pilots and mechanics. A base may also be staffed by medical crew members (paramedics, EMTs, doctors, and nurses). If not, the helicopter should reposition to a trauma center or other location where medical personnel are available for assignment to support operational requirements.

b. Operational Control. An HAA operator should be organized to ensure the challenges imposed by the need to perform HAA-specific training, operations, equipment installation and maintenance and documentation are adequately addressed. Operational control over the aircraft, pilots and flight operations should remain within the operator's organization regardless of customer prioritization, inputs, tacit expectations and pressures.

c. HAA-Specific Equipment. HAA-specific equipment (such as HTAWS, Flight Data Monitoring System (FDMS), etc.) and training are required for HAA operations, starting on effective dates provided in the applicable regulations. Such equipment and training has been identified as beneficial for improvements in flight safety and operational efficiency.

d. Maintenance. Helicopters should be maintained and serviced with particular attention to scheduling and accomplishing major inspections and maintenance while recognizing and accommodating customer expectations. Problems are likely to arise if operators defer, then extend, required maintenance to meet operational availability requirements. While the importance of helicopter availability is recognized in the HAA best practices referred to in this AC, HAA operator management, along with a pervasive "safety culture," should ensure that deferral of unscheduled repairs or replacements are not unduly extended to coincide with previously scheduled preventative maintenance or inspection requirements.

e. OCCs. Regulations require an OCC to be staffed by one or more OCS by those operators with 10 or more HAAs. The FAA strongly encourages similar steps by other operators. Formal Risk Analysis (composed of risk assessment and mitigation processes, not previously required of HAA operations), must be implemented by all HAA operators per § 135.617. Operator risk analysis programs should be well documented and consistently applied to avoid over-extending aircraft or pilot capabilities. Attempting to accomplish HAA operational objectives, in the absence of well thought-out and documented operational risk analysis procedures and training, can result in misplaced priorities, second-order effects, and unintended consequences and could result in poor judgment or decisionmaking.

f. Best Practices. Appropriate HAA industry experience and strong commitment to safe operations has been identified as a best practice of effective management personnel. In particular, effective action to assure flight safety by the director of operations, the chief pilot and the director of maintenance have been seen as essential to the best practices contributing to safe operations. Equally essential are policies and procedures emphasizing professionalism among all employees from the top down.

CHAPTER 2. CERTIFICATION AND HAA-SPECIFIC CONSIDERATIONS

2-1. GENERAL. A helicopter air ambulance (HAA), Title 14 of the Code of Federal Regulations (14 CFR) part 135 operation, as authorized through the issue of Operations Specification (OpSpec) A021, Helicopter Air Ambulance Operations, is unique among other types of part 135 helicopter operations. Organizational challenges are significant. This is reflected in the requirements for such operators under the certification process. Part 135 certificate holders conducting HAA operations are subject to requirements beyond those observed by other certificate holders.

2-2. INITIAL PART 135 CERTIFICATION WITH HAA AUTHORIZATION. Prospective helicopter operators desiring to offer HAA operations as an air carrier in accordance with part 135 should refer to the current edition of Advisory Circular (AC) 120-49, Certification of Air Carriers, for methods and procedures to follow in achieving certification. A Federal Aviation Administration (FAA) Web site with information on the certification process is: http://www.faa.gov/licenses_certificates/airline_certification/

a. Certification Team (CT). The Flight Standards District Office (FSDO) located in the area where the applicant desires to locate its principal business office will assemble a CT. This CT will provide certification process guidance to the prospective certificate holder. It will evaluate the systems, procedures, training, and documentation (manuals, etc.) that the applicant has documented and submitted (or demonstrated) toward earning their air carrier certificate.

b. Additional Information. Further detail about authorization for HAA operations, in addition to achieving part 135 certification, is included in this AC chapter.

2-3. ADDING HAA AUTHORIZATION TO AN EXISTING PART 135 CERTIFICATE. Existing part 135 certificate holders may perform HAA operations after providing training, meeting regulatory requirements, implementing appropriate procedures and installing equipment (described in subsequent chapters of this AC). Following an application for authority to perform HAA operations, supported by demonstrations of capability, the operator may be issued, by the FAA, the appropriate OpSpecs, including A021, Helicopter Air Ambulance Operations. The approving authority for the issuance of these OpSpecs will be the principal inspectors (PI) assigned to that certificate.

2-4. REGULATORY OPERATIONAL CONSIDERATIONS. HAA operators are subject to regulatory operational requirements above those associated with other part 135 operations. These are outlined in Chapter 3 of this AC. In addition, this AC will identify HAA industry best practices applicable to operational issues.

a. Part 135, § 135.603, Pilot Qualifications. Part 135 certificate holders conducting HAA operations are subject to pilot qualifications requirements in addition to those required of such certificate holders not engaged in such operations. Pilots employed in HAA operations must hold a rotary wing (RW) instrument rating or an airline transport pilot (ATP) certificate in accordance with § 135.603. This requirement becomes effective on April 24, 2017.

b. Section 135.609, Local Flying Area(s) (LFA) Familiarity Verifications. An examination of familiarity with a LFA is required to be completed and documented in a

12-month period before a pilot can use the lower weather minimums associated with the LFA. This examination of familiarity with a LFA may be through other means than a flight check. However, a record of all such examinations, regardless of format, must be retained for each pilot and each LFA assigned (refer to § 135.609). In this AC, see paragraph 3-5 for LFA operational considerations, paragraph 4-2 for LFA training implementation details, and paragraph 7-2 for LFA examination documentation requirements.

c. Sections 135.611 and 135.613, Instrument Flight Rules (IFR) Procedure Documentation. It is recommended that part 135 certificate holders conducting HAA IFR operations document procedures associated with point in space (PinS) approaches and associated Obstacle Departure Procedure (ODP). (Refer to §§ 135.611 and 135.613.)

d. Section 135.615, Visual Flight Rules (VFR) Flight Planning Documentation. Procedures for VFR flight planning must be documented by part 135 certificate holders conducting HAA operations in accordance with the provisions of § 135.615.

e. Section 135.617, Preflight Risk Analysis. An FAA-approved preflight risk analysis program must be established by each HAA operator and documented in its operational manual (or other documentation). In accordance with the provisions of § 135.617(d), part 135 certificate holders conducting HAA operations are required to use and retain preflight risk analysis worksheets. Preflight risk analysis worksheets are completed by the pilot and are reviewed and confirmed by the Operations Control Specialists (OCS) in compliance with § 135.617 if applicable. These worksheets are retained for 90 days in compliance with §§ 135.617 and 135.619. The procedure itself is outlined in paragraph 3-4 and Appendix A, which also includes examples of preflight risk analysis worksheets.

2-5. TRAINING CONSIDERATIONS. HAA operators are subject to additional training requirements above those associated with other part 135 operations. These training requirements will be outlined in Chapter 4. In addition, this AC will identify HAA industry best practices applicable to training, including providing examples of curriculum outlines and checklists as appendices.

2-6. EQUIPMENT CONSIDERATIONS. Part 135 certificate holders conducting HAA operations will utilize task-specific equipment associated with medical transport. An applicant should identify, in their initial application, any specialized equipment that may be used in their HAA operations. This equipment should include items required by regulations such as a Helicopter Terrain Awareness and Warning System (HTAWS) and a radio altimeter. By April 23, 2018, helicopters must equip Flight Data Monitoring Systems (FDMS). It may include a Night Vision Imaging System (NVIS) installation and other equipment fitted to bring each helicopter to a desired aeromedical configuration. Helicopters to be used in HAA operations are evaluated by FAA PIs.

2-7. INSPECTION AND MAINTENANCE CONSIDERATIONS. HAA operators should consider inspection and maintenance issues beyond those associated with other part 135 operations. This includes inspecting and maintaining equipment added for HAA operations. This equipment increases maintenance complexity and introduces second-order complications. These complications may include NVIS compatibility, electromagnetic compatibility (EMC)

verification, heat shielding, fire resistance, mechanical integrity of mounting, crashworthiness and infection control procedures. Maintenance hours and cost burdens will increase because of the need to remove and replace complex on-board systems, sealed interior panels, etc., when required to access aircraft systems for inspection, maintenance and repair. The operator should factor these considerations into both routine and unscheduled maintenance decisionmaking. For example, it is not acceptable to apply for multiple extensions on deferrals of required maintenance for minimum equipment list (MEL) items solely due to the cost burden associated with gaining access to make repairs. Be on guard against such practices. Standard MEL deferral decisionmaking should be consistently applied.

NOTE: Reference materials providing further guidance include: AC 27-1B MG 6, Miscellaneous Guidance (MG) for Emergency Medical Service (EMS) Systems Installations.

2-8. DOCUMENTATION AND RECORDKEEPING CONSIDERATIONS. All HAA operators are required to document preflight risk analysis and VFR flight planning procedures. In addition to the manual requirements imposed by § 135.21, it is recommended that each certificate holder conducting HAA operations, including single-pilot and basic operators, compile and maintain manuals reflecting the implementation of HAA best practices identified in this AC. Documentation and recordkeeping requirements associated with HAA operations beyond those normally required of part 135 operators are described in Chapter 7 of this AC.

CHAPTER 3. OPERATIONS

3-1. GENERAL. This chapter outlines recommendations regarding the conduct of Title 14 of the Code of Federal Regulations (14 CFR) part 135 helicopter air ambulance (HAA) operations.

3-2. OPERATIONAL CONTROL, FLIGHT LOCATING, AND FLIGHT FOLLOWING DUTIES AND RESPONSIBILITIES. Regardless of the size and complexity of the operation, the operator is responsible for maintaining operational control, accomplishing flight locating and supporting the pilot during preflight planning, risk analysis, and en route by providing information and constructive input which would aid the pilot in effective decisionmaking. Smaller operations may accomplish this through direct communication between the pilot and the management person to whom the authority to provide a flight authorization has been delegated. Larger operations may accomplish the same objective through pilot communication and discussion with a trained Operations Control Specialist (OCS).

a. Operational Control. Only those individuals authorized by name in an operator's operations specification (OpSpec) may exercise operational control. While operational control may be delegated to certain certificate holder personnel, it must never be delegated to customer hospitals or external emergency medical services (EMS) agencies.

b. Duties and Responsibilities. The pilot in command (PIC), by regulation, is the final authority for the operation of any HAA flight. It is an HAA industry best practice that a PIC may not "self-launch." Operators should establish procedures for coordination between the pilot and OCS, or other person authorized to exercise operational control, to evaluate flight risk analyses to ensure risk is mitigated to the extent possible or a flight request is declined due to unacceptable risk. While "three to go, one to say no" is a good practice (with the three being the PIC and two medical crew members, and the one being any one of the three), it is essential that no external pressure "to go" is applied to the pilot during the decisionmaking process.

NOTE: A PIC's decision to decline, cancel, divert or terminate a flight overrides any decision by any and all other parties to accept or continue a flight.

c. Flight Authorization and Flight Locating Procedures. Regardless of whether or not an operator uses an Operations Control Center (OCC), flight authorization and flight locating procedures should be well-considered and thoroughly documented to support training and operations. For those operators with an OCC, the description of the duties and responsibilities of OCSs and an explanation of their duty times in the current edition of Advisory Circular (AC) 120-96, Integration of Operations Control Centers into Helicopter Emergency Medical Services Operations, should amplify the above. In addition, the rule describing OCS training part 135, § 135.619(f) is an excellent guide to the subject matter considerations involved in issuing a flight authorization and with reacting to flight locating adverse outcomes. The certificate holder is required by regulation to use flight locating procedures (refer to § 135.79), unless a Federal Aviation Administration (FAA) flight plan is filed and activated.

d. Flight Following.

(1) Flight Following Recommendations. Flight following is distinguished from flight locating. Flight locating is required for HAA operations unless an FAA flight plan is filed and activated. While § 135.619 requires an OCC to monitor the progress of a flight, for smaller operators (ten or less HAAs), it is a good practice to employ flight following.

(2) Flight Following Connectivity. Flight following should maintain voice communications with helicopter pilots during HAA operations. The operator may wish to consider employing satellite/Global Positioning System (GPS) tracking for flight following tasks as a supplement or substitute for voice radio connectivity.

(3) Flight Following Latency. It is recommended that a position and status report be made, at most, every 15 (in flight) to 45 (on ground) minutes. If communication is lost, the aircraft may be considered missing after failing to provide sequential routine position reports (usually two reports). The longer the time between position reports, the greater the radius of uncertainty of the missing helicopter's location. The operator should also consider employing satellite/GPS tracking for flight following tasks as a substitute for voice radio connectivity.

e. Flight Following and Accident Incident Plan/Post-Accident Incident Plan (AIP/PAIP). Each OCC or other flight following office should have access to the operator's AIP/PAIP. The plan should be reviewed and updated annually or more frequently as needed.

(1) Information in the AIP/PAIP defines and provides direction for emergency response procedures that should be used as a basis for training or for reference in the event of a mishap, accident or other emergency. The AIP/PAIP establishes standard emergency response procedures that OCCs or flight followers will carry out in all cases when an aircraft meets operator-defined criteria of being overdue or has been involved in an incident or accident.

(2) The AIP/PAIP and any other emergency response plans and guides may be formatted in a variety of ways, provided the user (that is, the individual making the initial response to the emergency) can easily determine where to find guidance for a situation and then follow a generic checklist of actions to be taken for that situation. An addendum to the main response plan should be available for every satellite base. Each local addendum should list direct-dial phone numbers for the satellite base manager, local first responder and 911 dispatch organizations, local air traffic control (ATC) and local FAA offices.

f. Communications Personnel and Procedures. Chapter 6 of this AC provides recommendations to assist HAA operators with best practices for implementing OCCs and operational control procedures.

(1) Large HAA operators have developed OCCs to maintain operational control. While there is a regulatory requirement (§ 135.619) for operators with 10 or more HAAs to have OCCs, smaller operators should consider the benefits that best practices have shown can be implemented on a scalable level to meet the needs of smaller operators.

(2) Operators without an OCC, and large operators may find it advantageous to supplement their Operational Control personnel through the addition of Communications

Specialist Staff. If this is the case, the Operator must train and qualify their Communications Specialists to the extent their duties and responsibilities reflect delegated Operational Control tasks. For example, if a Communication Specialist is responsible for performing flight locating duties via radio or other communications process, and to receive and offer the operator flight requests for HAA operations their training should include company policy and procedures for such activity.

(3) A communications specialist may be an employee of the HAA operator, a hospital (i.e., a hospital communications specialist) or a local public safety agency (i.e., a 911 dispatch operator). If communications specialist duties are delegated beyond certificate-holder personnel, such as to a hospital or ambulance dispatch center, those individuals serving in that capacity must be trained by the certificate holder and such training programs must be documented.

(4) The primary function of the communications specialist is to support HAA operations by relaying coordination information and situational awareness information among the flightcrew, hospital, and on-scene personnel and other involved organizations and individuals. Providing and receiving in-flight updates and post-flight debriefs to flightcrews have been identified as part of their recommended functions.

(5) HAA best practices suggest that the responsibilities of communications specialists should include ascertaining, from those requesting HAA services, whether another HAA operator has previously declined to carry out a particular flight and, if so, for what reason. The response received should be conveyed to the pilot performing the Risk Analysis in accordance with § 135.617. The personnel that carry out this function may or may not be the same as those who carry out in-flight connectivity and flight locating functions during HAA operations.

(6) Depending on the size and nature of HAA operations, different communications specialist functions may be split between multiple individuals (who may also carry out other functions) or concentrated in one or more communications specialists.

(7) Communications specialist duties may include flight following. Best practices suggest that an HAA operator's communications system should provide reliable connectivity with HAAs in flight and on the ground, enable flight locating (required by regulation for some operators and recommended for all others) and ensure that medical personnel and pilot(s) can communicate with recipients such as hospitals and ground personnel at a Landing Zone (LZ). Some rural hospitals may not have communications capability other than by phone. Communications specialist personnel may be required to act as an intermediary.

(8) In all cases, when communications specialists perform an OCS duty included in § 135.619(a)(1-4), the communication specialist is subject to training and checking in those subjects that support the duty performed and must be trained in the limit of authority delegated to them.

3-3. VISUAL FLIGHT RULES (VFR)/INSTRUMENT FLIGHT RULES (IFR) FLIGHT PLANNING AND WEATHER MINIMUMS.

a. Flight Planning (refer to §§ 135.613 and 135.615).

3/26/15

AC 135-14B

(1) HAA VFR flight planning must take into consideration factors including the determination of highest obstacles and minimum cruising altitudes along planned routes as well as contingencies such as deviations due to medical necessity, dynamic weather and changes to the planned flight. The procedures defining these planning methods must be documented. (Refer to § 135.615 for regulatory requirements.)

(2) IFR/VFR Procedures. For operators with IFR authorization, procedures for transitioning from IFR to VFR on approach or from VFR to IFR on departure are required to be documented.

b. Approach Procedures Minimums (refer to §§ 135.609, 135.611 and 135.613).

(1) When executing Point in Space (PinS) Copter approaches that include a “proceed visually” transition, the flight will remain under IFR from the missed approach point (MAP) to a served heliport and the transition must be conducted in accordance with the ceiling and visibility limitations published in the PinS Copter Instrument Approach Procedure (IAP).

(2) When executing PinS Copter approaches that include a “proceed VFR” segment between the MAP and a served heliport, flights must be conducted in accordance with the ceiling and visibility limitations published in § 135.613(a).

(3) When accessing a heliport near an airport served by an IAP, the pilot may execute a published IAP to an airport which is not the intended landing site, and then break off that published approach after visually acquiring the airport served by the approach and then proceed to a landing area other than the airport to which the approach was conducted. The pilot may accomplish this only under VFR weather minimums in accordance with § 135.613(a) or under VFR as appropriate to the class of airspace involved and in accordance with ATC clearances. (The airspace between the protected area surrounding the approach to the airport and the intended landing area located nearby may not be surveyed and obstructions may exist between the airspace protected for the airport served by the IAP and the intended landing site.)

c. Departure Procedures Minimums (refer to §§ 135.609 and 135.613).

(1) HAA Helicopters may depart on an IFR clearance from the surface, at heliports that are not served by weather reporting, providing the heliport is served by a departure procedure (Standard Instrument Departure (SID) or Obstacle Departure Procedure (ODP)) containing ODP and takeoff minimums, and the pilot determines the weather at the departure point meets or exceeds the published takeoff minimums. The flight may depart and proceed visually in accordance with the instructions contained in the DP.

(2) When departing VFR from heliports with the intent of acquiring an IFR clearance at or before reaching a predetermined point (usually the Initial Departure Fix (IDF) not more than 3 nautical miles (NM) from the departure point, the flight must be conducted in accordance with the DP instructions and the ceiling and visibility limitations contained in § 135.613(a). If the distance between the departure point and the IDF exceeds 3 NM, the flight must be conducted in accordance with the VFR ceiling and visibility minimums for the class of airspace involved. The operator should document procedures for transitioning from IFR to VFR on approach or from VFR to IFR on departure.

(3) If the departure involves a VFR to IFR transition and does not meet the requirements of § 135.613(b)(1), there is no departure procedure, and/or the IDF is more than 3 NM from the point of liftoff, the VFR weather minimums required by the class of airspace apply. If the flight is within Class G, airspace, refer to § 135.609, if within Class B, C, D, or E airspace, refer to § 135.205.

(4) These regulations do not restrict or prohibit “diverse departures” from airports from which IFR departures can be made in accordance with 14 CFR part 97. These are departures from airports with IAPs that have had an obstacle analysis conducted and from which it was determined IFR departures can be performed safely without a published ODP or SID.

(5) An IFR clearance and departure with “proceed visually” text is not considered a VFR maneuver and is not subject to § 135.609 limitations unless the pilot is instructed by ATC to maintain VFR. For this type departure, the weather must meet or exceed either the published “takeoff minimums” contained in the DP, or the restrictions in contained in § 135.613 or in § 135.609, as applicable.

d. Flight Into Locations Without Weather Reporting (refer to § 135.611(a)(3)). In accordance with the provisions of § 135.611(a)(3), the PIC may assess the weather at a departure point where weather reporting is not provided. This is a process where the PIC applies his own professional judgment to determine the weather conditions. The pilot may be assisted by access to enhanced situational awareness provided by the OCC or other aviation or non-aviation weather sources. (See Chapter 6 of this AC and AC 120-96 for more information.)

(1) Based on this weather assessment, the PIC may:

- Takeoff when the observed ceiling and visibility is greater than the weather minimums as published in a departure procedure; or
- Takeoff when a documented departure procedure is not available and when the observed weather is greater than the higher minimum ceiling and visibility limitations required by § 135.609, or for the Class B, D, or E airspace overlying the departure point, as applicable.

(2) The FAA intends to permit HAA flights to enter the National Airspace System (NAS) under IFR when visibilities and ceilings are below VFR minimums, based on the pilot’s weather observations, thus increasing the safety of the flight. This rule permits HAAs to depart heliports with a published IAP and departure procedure with no reported weather under IFR, rather than forcing them to depart under VFR, which in low ceiling and visibility conditions is more hazardous.

e. Weather Minimums (refer to § 135.609). Section 135.609 specifies HAA minimums for Class G airspace. HAA operations use higher ceiling and visibility minimums in uncontrolled airspace in uncontrolled airspace than is required for conventional part 135 operations. Each HAA base may establish one or more local flying areas (LFA) where lower minimums may be used. See paragraph 3-5 of this AC on LFAs.

3-4. PREFLIGHT RISK ANALYSIS (refer to § 135.617). Preflight risk analysis is a key subject of this AC. It is discussed in chapters 3, 6, and Appendix A. This AC provides guidance for implementation of regulatory requirements. Each HAA operator, regardless of size, must design, develop, document and implement an FAA-approved preflight risk analysis process. Only processes that have been documented and have been the subject of training, meet regulatory requirements. (Refer to § 135.617.)

a. Risk Analysis Steps. Risk analysis includes the following steps:

(1) Risk identification. What are the risks and their importance in quantitative terms?

(2) Mitigation. What changes or approaches reduce the effect of risks?

(3) Calculation of Residual Risks. What risk remains after mitigation?

(4) Management Review. Elevation of higher risk assessment to appropriate management levels for concurrence.

b. Risk Analysis. Risk assessment is a key element of risk analysis. Its process documentation should identify risk factors the HAA operator may consider. This assessment should consider not only the primary intended flight operation but also all contingencies that can reasonably be foreseen. The PIC does not have to perform a new risk assessment prior to a change in destinations. As part of risk assessment, these factors are quantified. The operator should assign to each risk factor an appropriate value reflecting both the likelihood of occurrence and severity of outcome. Combining the value associated with each risk factor will yield a total risk value. An example of this is provided in Appendix A.

c. Flight Authorization. Each HAA operator must document procedures for obtaining and documenting approval by management personnel to authorize a flight when a single or cumulative risk exceeds a level predetermined by the operator. If this value exceeds that predetermined level, it will require management approval or preclude operations. After all risks are identified and risk control strategies and their effects are considered, an informed go/no-go decision can be made. The effect of risk assessment on mitigation strategies and restrictions on acceptable risks must be documented.

d. Risk Assessment Quantifies at Least the Following Risk Factors.

(1) Aircraft Capabilities, Flight Route and Landing Site Considerations. This includes performance, fuel required, resulting useful load, environmental factors and their effect on performance with all engines operating and, as applicable, with one engine inoperative as well as obstacles and terrain along the planned route of flight and LZ conditions. In-flight changes to routes or destinations do not necessarily require a full risk analysis, provided these options or contingencies were considered in the original risk analysis of the flight operation that was conducted prior to the flight operation was initiated. The original risk analysis should be updated, considering factors which have changed, such as: fuel required, fatigue, airworthiness, and dynamic weather conditions, etc.

(2) Current and Forecast Weather. This includes ceiling, visibility, precipitation, surface winds, winds aloft, potential for ground fog (especially for off-airport scene response operations), and severe weather such as thunderstorms and icing. These factors should be considered for the departure point, en route, and primary destination and contingency routes/diversion landing facilities.

(3) Human Factors. This includes sources of stress such as health, fatigue, circadian effects, flight difficulty, operational complexity and potentially distracting life events. All these are among the many potential contributors to human failure. Human factors considerations should include information such as pilot experience level and operation-specific hazards that also reflect environmental factors.

(4) Declined HAA Flight Requests. The operator must establish a procedure for determining whether another HAA operator has declined the flight request under consideration and if so, for what reason (weather, maintenance, etc.). If applicable, the reason for the declined flight must be factored into the required risk assessment process, i.e., do not include a declined flight due to a maintenance issue or pilot not available. This could be as simple as asking the requestor whether or not this specific flight request has previously been made and declined and why.

(5) Risk Determined Independent of Patient Condition. It should be assumed that HAA operators and personnel are dedicated to making every flight requested, providing the level of risk is acceptable. Best practices in the industry indicate the medical condition of a patient should not be considered in the risk analysis process and that the PIC should not be briefed on this factor in advance of decisionmaking.

e. Mitigation. Identified risks may be mitigated by changing how a proposed HAA flight is conducted. The operator must develop strategies and procedures for controlling risks imposed by identified hazards. For examples of mitigation, refer to Appendix A.

f. Calculation of Residual Risk. After risk is analyzed and quantified and then mitigated, the degree of residual risk is assessed. Residual risk is the safety risk that exists after all controls have been implemented or exhausted and verified.

g. Elevation of Higher Risk Analysis to Appropriate Management. An HAA operator is required to define risk-based flight authorization limits based upon a quantitative assessment of each specific flight operation. Higher risk assessments are referred to an appropriate manager with operations control authority.

h. Reconsideration of Flight Authorization. Material changes in any of the major risk factors considered in the decisionmaking process should trigger reconsideration of flight authorization. This especially applies to deterioration in weather or other environmental conditions or deterioration of patient condition resulting in an unplanned diversion.

3-5. LFAs (refer to § 135.609).

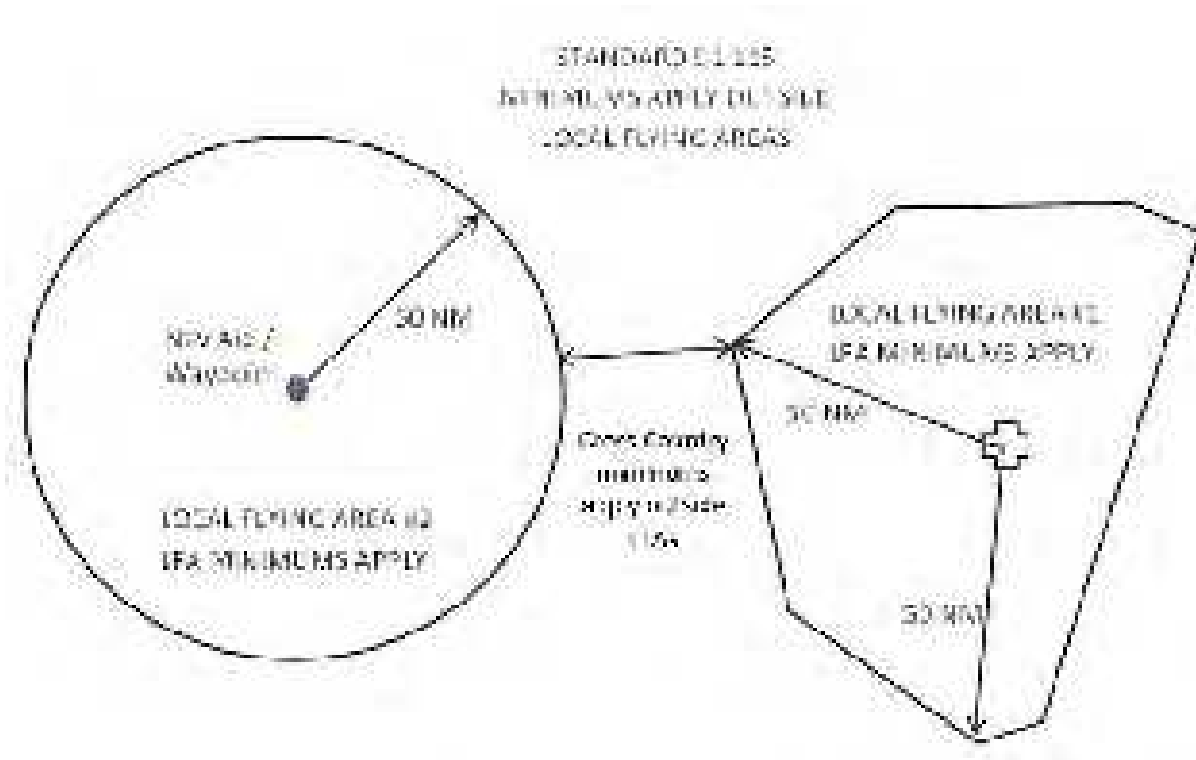

a. Establishing LFAs.

(1) Each HAA base may establish one or more LFA. A LFA is considered a defined or bounded area within which a HAA pilot has demonstrated detailed local knowledge and within which lower Class G weather minimums may be applicable.

(2) A LFA may be symmetrical, such as an area encompassed by a fixed radius from a point designated by the operator or, alternatively, it may be asymmetrical, using landmarks and geographical features to bound the area. In any case, a designated LFA should not exceed 50 NM in any direction from the designated location.

(3) LFA(s) need not be contiguous. There is no requirement that a LFA for a particular base of operations consist of only one defined area. For example, if an operator that conducts HAA operations in a particular metropolitan area, but often transports patients to a regional trauma center outside that area, may choose to develop an additional LFA for assigned pilots to use when operating near the trauma center. While operating in-between LFAs, cross-country minimums would apply.

FIGURE 3-1. EXAMPLE OF LOCAL FLYING AREA(S) AND WHERE CROSS-COUNTRY MINIMUMS APPLY

b. References. References to define a LFA may include:

(1) A specific radius from a point (if easily identified using installed operational avionics).

(2) Bounding natural and constructed references (rivers, shorelines, roads, railroads, etc.).

(3) Governmental boundaries, if easily identified from the air.

(4) By describing an area bounded by natural, constructed or aeronautical reference points (shoreline points, islands, valleys, buildings, airports, very high frequency (VHF) omnidirectional range station (VOR), GPS waypoints, etc.).

(5) Any other reasonable description of an area that may be easily applied by a flightcrew, such as a predetermined route or system of routes.

c. Effects of LFA on Minimum Acceptable Weather Conditions. Establishment of a LFA allows for the use of lower weather minimums as specified in § 135.609. This is only available for use by pilots that have demonstrated LFA familiarity.

d. Demonstration of LFA Familiarity. A pilot must demonstrate a level of familiarity with a LFA by passing an examination given by the certificate holder within the preceding 12 calendar-months prior to using a LFA's local area weather minimums as specified in § 135.609. This examination may be oral or written and may be part of a line check consisted under § 135.299. The manner of the examination must be described in the operator's training program. The grace provisions of § 135.301 apply. This examination should include at least the following:

(1) Terrain features and LFA boundaries.

(2) Prominent obstructions including areas of obstruction.

(3) Minimum safe altitudes in the area.

(4) Weather producers (such as industrial areas, fog-prone areas, etc.).

(5) Areas of poor surface lighting and the effects of seasonal and other changes on surface lighting, as applicable to the area.

(6) Airspace control/air traffic facilities.

(7) Radar and communications coverage, including minimum altitudes for radar service and communications with air traffic facilities and company communications facilities.

(8) Airports/heliports/fuel sources, including night availability; available instrument approaches.

(9) Predominant air traffic flows.

(10) Landmarks and constructed features.

(11) Facility-specific information such as flight locating, dispatch and communications.

(12) Any emergency considerations specific to the area.

NOTE: A record of the examination must be kept in accordance with records retention requirements.

3-6. HAZARDS TO OPERATIONS: IDENTIFICATION AND MITIGATION.

a. Hazard Map. One (or more) hazard maps should be developed. While hazard maps should be developed to cover the entirety of each LFA, such maps may be more extensive than a LFA. The map should be reviewed and updated periodically or as new information becomes available. It should be displayed in a conspicuous location for pilots to review. All potential hazards should be annotated. Power lines, towers and tall structures in the vicinity of designated LZs are particularly important. A system to identify and depict newly-added hazards and to ensure pilots are aware of them should be developed. VFR/IFR transition corridors and preferred routes should appear on hazard maps. Recommended practices include treating the hazard map as a living document, updated by the use of grease pencils or map pins with appropriate notes or captions. Transient hazards (including those created by changing light and visibility or recorded in Notices to Airmen (NOTAM)) should appear on the map with their applicable times.

b. Flight Controls. Leaving the flight controls of a helicopter while rotors are turning is a potentially hazardous situation that may be encountered in HAA operations. While current regulations do not prohibit the pilot from leaving the controls while the helicopter is operating, HAA operators are urged to include procedures for accomplishing this safely in their documented operational procedures and training.

c. Magnetic Resonance Imagery (MRI) Systems. Caution should be used in vicinity of MRI systems. Interference from MRI systems may cause fluctuations in compass accuracy and in instruments for up to 30 minutes and render them unusable. MRI systems may also cause interference with full-authority digital electronic control (FADEC)-equipped aircraft.

3-7. HAA WEIGHT AND BALANCE (W&B) CONSIDERATIONS. Because of the need for specialized equipment, medical personnel and patients to be carried from a wide range of locations and in a wide range of conditions, W&B considerations for HAA operators differ from those of other part 135 operators. Most HAA helicopters have strictly limited payloads due to installed equipment configurations. This AC identifies requirements and best practices considerations.

a. W&B Requirements of HAA Operators. Certificate holders should develop a W&B program as illustrated in OpSpecs A096/A097, using actual weights for crewmembers, medical personnel and carryon medical equipment (not permanently installed on the aircraft), and only relying on solicited or estimated weights for patients, regardless of the size of the helicopter. Certain medical equipment (e.g., isolettes and balloon pumps that are removed and replaced as needed) may not technically be installed but rather should be considered similar to carry-on baggage, be properly secured, and counted toward payload.

b. W&B Programs of HAA Operators. An approved W&B program is required to be documented and listed in the certificate holder's General Operations Manual (GOM), if applicable. It will be approved in the operator's OpSpecs. See guidance for OpSpecs A096/A097 for more details. A W&B control system may include the following:

(1) An index-type W&B program that makes use of actual weights for crew members and equipment and average weights for patients may be established in accordance with the appropriate OpSpec (either A096 or A097) and the current edition of AC 120-27, Aircraft Weight and Balance Control. Company manuals should contain procedures for using, managing and updating W&B data. A loading schedule should be prepared composed of graphs and tables based on pertinent data for use in loading that particular helicopter in a rapid manner for HAA operations.

(2) Best practices in the industry are that operators prepare W&B for multiple configurations of each helicopter in terms of differences in occupants and equipment, especially common configurations (e.g., one or two pilots, one or two medical personnel, one or two patients, large carry-on equipment, balloon pumps, fuel in the most critical center of gravity (CG) locations, training configuration, etc.)

(3) Operators must amend individual helicopter W&B documentation when equipment is removed or replaced. If medical equipment is modified or medical supplies are upgraded, the operator must ensure the resulting changes in weight and location inside the helicopter are reflected in the W&B documentation required by the OpSpecs.

3-8. HELIPOINTS/LZs. HAA operators should establish procedures for conducting airborne and ground reconnaissance of all types of heliports/landing zones. This is especially important for off-airport LZs or heliports not used on a routine basis.

a. LZ Criteria. Criteria should be established, documented and included in training programs to assess each heliport/LZ on a continuing basis prior to use. The operator should document criteria for LZ selection. These criteria should include size, obstructions, lighting, surfaces, wires and methods to determine wind direction, etc. A reporting system for unsatisfactory or dangerous conditions and a continuing LZ evaluation program should be part of HAA operations

b. Heliports. When part 135 HAA operations are conducted from established heliports, those heliports should meet the criteria established in the current edition of AC 150/5390-2, Heliport Design, to the maximum extent possible.

c. Approach/Departure. For operations over congested areas, ingress/egress routes to heliports or “scene” locations may have to be modified to adhere to best safety practices. Whenever possible, helicopter operations should include the best practices of “flying neighborly,” as described in the Helicopter Association International (HAI) Fly Neighborly Guide.

d. Ground Security. Best practices suggest that an off-airport or heliport, LZ or “scene” location should be secured against incursions and other hazards by law enforcement or firefighters.

e. LZ Listing. HAA operators should maintain a listing of routinely used off-airport LZs containing pertinent information. This listing should be available to HAA pilots. A system should be established to familiarize pilots with all heliport/LZs serviced by a hospital or certificate holder. A method considered acceptable would be using photographs, drawings and

other descriptive means to identify each heliport/LZs with emphasis on timely recording of any obstructions. The site evaluation should include the following:

- (1) Identification and/or removal of obstructions;
- (2) Assessment of area lighting/transient light conditions;
- (3) Awareness of helicopter ingress/egress limitations; and
- (4) A reporting system for unsatisfactory or dangerous conditions.

3-9. OPERATIONS UNDER SPECIAL CONDITIONS.

a. Inadvertent Instrument Meteorological Conditions (IIMC).

(1) Operators should develop and document operational procedures for avoiding flight into IIMC along with procedures to be followed after IIMC is encountered. Both of these sets of procedures should include operations in an ATC radar environment as well as IIMC in isolated areas or a non-radar environment.

(2) Avoidance of entry into IIMC should be emphasized in HAA training and operations. A thorough weather briefing, proper analysis of weather (especially that potentially affecting in-flight route changes) and incorporation of adverse weather conditions into risk analysis should help prevent encounters with IIMC. HAA-appropriate training for IIMC flight is discussed in paragraph 4-3 of this AC.

(3) Some best practices for avoiding flight into IIMC include procedures that specify HAA pilots execute a contingency plan whenever speed or course adjustment is required due to deteriorating weather conditions. This contingency plan could be to execute a course reversal to leave the area of deteriorating weather or the execution of a precautionary landing to avoid entering IIMC.

(4) Procedures to be followed by a HAA pilot after entering IIMC should be developed and documented. These procedures should be tailored to each HAA base or operating area. For example, a HAA base that routinely operates near airports with an ATC control facility might establish procedures for contacting ATC and receiving radar vectors to visual meteorological conditions (VMC) or for an instrument approach. A base that operates in areas without local approach control or radar services might pre-designate airports in their service area where IAPs are available. Approach procedure information for those airports could then be kept in the cockpit, readily available should the need arise.

(5) HAA operators may request the use of a discrete transponder code from a local air traffic facility for use when conducting HAA operations in its area of responsibility. This would provide positive identification during an HAA flight.

(6) Operators are also encouraged to meet with local ATC facility personnel to formulate and coordinate instrument meteorological conditions (IMC) “emergency escape plans

and procedures” for participating HAA aircraft. These plans and procedures may be established with a letter of agreement (LOA) between an operator and its local air traffic facility.

(7) In the event IMC is inadvertently encountered, weather observations and forecasts assessed during the timely performance of preflight planning and the risk analysis process did not, in the pilot’s judgment, indicate that an IIMC event was likely, and the pilot subsequently performs an FAA accepted IIMC emergency recovery procedure, FAA personnel are discouraged from conducting enforcement against the pilot or the operator.

NOTE: IIMC avoidance and recovery training should in no way be construed as authorizing or condoning actual IMC flights without meeting IFR requirements.

b. Night Operations.

(1) A PIC must meet the requirements of 14 CFR part 61 and should complete the certificate holder’s night training before conducting any night operations. A certificate holder should develop and document procedures for maintaining night proficiency in HAA operations. Pilots must be capable of meeting night recency of flight requirements to fly with or without night vision goggles (NVG). NVG recency of flight experience is defined in part 61, § 61.57(f).

(2) Night landings at unimproved sites, authorized by OpSpec A021, are permitted with adequate and appropriate lighting for the pilot to identify the landing site and surrounding hazards. Such lighting must be compatible with the Night Vision Imaging System (NVIS) if authorized and used.

NOTE: “Adequate” lighting allows a helicopter pilot to conduct a safe approach and landing during conditions of darkness while avoiding terrain and obstacles. The source of this lighting may be on the helicopter or on the surface and includes the possibility of vehicle-mounted lights being used to illuminate a landing site. Pyrotechnic road hazard flares are not recommended for illumination or marking a landing site.

c. Overwater Operations.

(1) Preflight passenger briefings for overwater flight must instruct on use of regulation-compliant life preservers and emergency exits. See the definitions in paragraph 1-6 for autorotational distance, shoreline, or suitable offshore heliport structure. (Refer to §§ 135.117, 135.167, and 135.168.)

(2) Best practices suggest that passengers be briefed anytime there is overwater flight although the regulations address only flights beyond autorotational distance.

d. Flat Light, Whiteout and Brownout. After April 22, 2015, in accordance with the requirements of § 135.293(h), all rotorcraft pilots must be tested on procedures for aircraft handling in flat light, whiteout and brownout conditions, including methods for recognizing and avoiding those conditions. HAA operators are susceptible to all of these conditions due to the nature of off-airport landings and operating in remote environments. These following are not

intended to be scientific explanations, but serve as operational definitions suitable for use by HAA operators. These terms should not be used interchangeably.

(1) Flat Light. Flat light is an optical condition, also known as sector or partial whiteout. It is not as severe as whiteout but this condition causes pilots to lose depth-of-field and vertical orientation. Flat light conditions are usually the result of overcast skies over snow or ice fields, inhibiting visual reference. Such conditions can occur anywhere in the world, primarily in snow-covered areas but they can also occur in dust, sand, mud flats or on glassy water. Flat light can completely obscure features of the terrain, creating an inability to distinguish distances and closure rates. As a result of this reflected light, it can give pilots the illusion of ascending or descending when actually flying level. However, with good judgment and proper training and planning, it is possible to safely operate aircraft in flat light conditions.

(2) Self-Induced Whiteout/Brownout. This effect typically occurs when a helicopter takes off or lands on a dusty or snow-covered area. The rotor downwash picks up particles and re-circulates them through the rotor system. The effect can vary in intensity depending upon the amount of light on the surface. This phenomenon can happen on the sunniest, brightest day with good contrast everywhere. However, when it happens, there can be a complete loss of visual clues. If the pilot has not prepared for this immediate loss of visibility, the results can be disastrous.

(3) Some resources that HAA operators have available to assist with training in these conditions include:

- Airman's Information Manual, paragraph 7-5-13; and
- FAA FAAS Team Library, Flying in Flat Light and White Out Conditions.

e. Operations Involving Multiple Aircraft—General. HAA operator service areas often overlap other HAA operator service areas. Standardized procedures can enhance the safety of operating multiple helicopters at heliports, LZs and hospitals. Communication is critical to successful operations and maintaining orderly separation and coordination between helicopters, ground units and communication centers. HAA operators should establish joint operating procedures and provide them to related agencies.

f. Recommended Multi-Aircraft Landing Zone Procedures. Based on existing industry conventions and material in the AIM, best practices identified include: The first helicopter to arrive on-scene should establish communications with an on-scene ground unit when at least 10 NMs from the LZ to receive a LZ briefing and to provide incident command with the number of helicopters that can be expected. An attempt should be made to contact other helicopters on VHF communications frequency 123.025 megahertz (MHz) to pass on to them pertinent LZ information and the ground unit's frequency. Subsequent helicopters arriving on-scene should establish communications on 123.025 MHz at least 10 NMs from the LZ. After establishing contact on 123.025 MHz, they should contact the ground unit for additional information. All helicopters should monitor 123.025 MHz at all times.

(1) If an LZ is not established by the ground unit when the first helicopter arrives, then the first helicopter should establish altitude and orbit location requirements for the other arriving

helicopters. Recommended altitude separation between helicopters is 500 feet (weather and airspace permitting). Helicopters can orbit on cardinal headings from the scene coordinates.

(2) Upon landing in the LZ, the first helicopter should update the other helicopters on the LZ conditions, i.e., space, hazards and terrain.

(3) Before initiating any helicopter movement to leave the LZ, all operators should attempt to contact other helicopters on 123.025 MHz, and state their position and route of flight intentions for departing the LZ.

g. Recommended Multi-Aircraft Hospital Operations. Many hospitals require landing permission and have established procedures (frequencies to monitor, primary and secondary routes for approaches and departures and orbiting areas if the heliport is occupied). Pilots should always receive a briefing from the appropriate facility (if required, making contact through the use of the HAA operators' communication center, flight following, etc.) before proceeding to the hospital.

(1) In the event of multiple helicopters arriving at a hospital heliport, each arriving helicopter should contact other inbound helicopters on 123.025 MHz and establish intentions.

(2) To facilitate approach times, the PIC of a helicopter occupying a hospital heliport should advise any other operators whether the patient will be off-loaded with the rotor blades turning or stopped, and the approximate time to do so.

(3) Before making any helicopter movement to leave the hospital heliport, all operators should attempt to contact other helicopters on 123.025 MHz and state their position and route of flight intentions for departing the heliport.

3-10. PATIENT/PASSENGER HANDLING/SAFETY.

a. Documentation of Procedures. Restraint of all personnel in flight is required by § 135.117. As in all part 135 passenger-carrying operations, passenger briefing cards are required in HAA operations. Operators are encouraged to document procedures for the proper restraint of all flight personnel and passengers and the proper use of seatbelts and shoulder harnesses during HAA operations. In addition, it is the responsibility of the PIC to insure passengers (such as hysterical or combative patients) who may pose a hazard to the aircraft or occupants are properly restrained before takeoff. Procedures detailing the proper restraint of patients/passengers should be detailed and documented, taking into account local law and applicable regulations.

b. Training in Procedures. A person designated and trained by the operator may conduct the passenger briefing required by § 135.117. If passenger briefing duties are delegated to non-flightcrew member, the procedure must be covered in the operator's operations and training manual or other appropriate documentation.

3-11. BIOHAZARD CONTROL. HAA operators are encouraged to educate pilots, medical crewmembers, and maintenance personnel in mitigating exposure to blood borne pathogens and biohazards. They should observe universal precautions and receive appropriate vaccinations

prior to working on or around HAA aircraft. Procedures should be established for each base for HAA and equipment cleaning and the disposal of biohazard materials.

3-12. FLIGHT TIME, DUTY PERIODS, AND REST REQUIREMENTS.

a. Flight Time/Duty Limitations and Rest Requirements. Part 135 subpart F offers multiple ways to comply with this requirement. Each operator needs to maintain records for its personnel and distinctly differentiate their flight time, duty time and rest time.

(1) Section 135.267 is applicable to unscheduled on-demand part 135 flights with one or two pilots.

(2) Most HAA operations are conducted under the provisions of §§ 135.267 and 135.271. The much less commonly used provisions for conducting HAA operations are those in § 135.271. This section was developed specifically for part 135 HAA operations by hospital-based programs. This section is more restrictive than § 135.267. Under the provisions of § 135.271, a flightcrew member may not be assigned any other duties while assigned to HAA flight(s.) A pilot that does not receive the required rest period must be relieved of any flight assignment. A certificate holder operating under § 135.271 should establish a recordkeeping mechanism to show that only bona fide air ambulance flights are conducted during these assignments.

NOTE: Both §§ 135.267 and 135.271 require a comprehensive recordkeeping process.

NOTE: Company training manuals and OpSpecs should specify which of these sections the HAA operator will comply.

b. Pilot/Helicopter Ratio. For 24-hour HAA operations, it is recommended that no fewer than four pilots be assigned per helicopter. An HAA operation with a high operational tempo or those with unusual circumstances may require a higher pilot-to-helicopter ratio. Sufficient staffing levels should be established to promote operational safety standards.

c. Maintenance Personnel Rest. Each HAA operator should establish rest policies for maintenance personnel similar to those for flightcrew. Rest periods should be 10 consecutive hours within the previous 24 hours and at least one 24-hour day for every seven 24-hour days. This requirement should be the same for contractors or vendors performing maintenance.

d. Flightcrew Member Rest Area. An adequate rest area should be provided for flightcrew members assigned HAA duty. This facility is an explicit regulatory requirement for those operators operating in accordance with § 135.271. This area should be at or in close proximity to a hospital or other approved location at which the HAA assignment is performed. A crew rest area should be available on a continuous basis exclusively for flightcrew members away from the general flow of vehicle and pedestrian traffic and should provide a shower, toilet and changing facilities, a bed with sheets, pillow and blankets, and be environmentally controlled for comfort.

3-13. RAPID FUEL AND OXYGEN REPLENISHMENT PROCEDURES. Refer also to the current edition of AC 91-32, Safety in and Around Helicopters.

a. Training and Qualification. The operator must train and qualify all applicable personnel in rapid fuel and oxygen replenishment procedures before conducting such operations. The operator should include the following points in their procedures:

(1) Only turbine engine helicopters fueled with JET A or JET A-1 fuels should be refueled while an engine is running.

(2) Oxygen replenishment should not be conducted while refueling operations are underway.

(3) Helicopters being refueled while an engine is running should have all sources of ignition or potential fuel spills located above the fuel inlet port(s) and above the vents or tank openings. Ignition sources may include, but should not be limited to the following:

- Engines,
- Exhausts,
- Auxiliary power units (APU), and
- Combustion-type cabin heater exhausts

(4) Only under the following conditions should operators permit helicopter fuel and oxygen servicing while engines are running:

(a) A company trained and qualified helicopter pilot should be at the aircraft controls during the entire rapid fuel and oxygen servicing process.

(b) Patients should be off-loaded to a safe location before rapid refueling or oxygen replenishment operations. *Where the PIC deems it necessary for patients to remain onboard for safety reasons, all helicopter engine(s) should be shut down and the replenishment conducted with the engine(s) off.*

(c) Passengers should not be loaded or unloaded from the aircraft during rapid replenishment operations.

(d) Only designated personnel, properly trained in rapid replenishment operations, should operate the fuel and oxygen dispensing equipment. Written procedures should include the safe handling of the dispensing equipment.

(e) All doors, windows, and access points allowing entry to the interior of the helicopter that are adjacent to, or in the immediate vicinity of, the fuel inlet ports should be closed and should remain closed during refueling operations.

(f) Before introducing fuel into the helicopter, the helicopter should be bonded to the fuel source to eliminate the potential for static electricity arcing.

(g) Fuel should be dispensed into an open port from approved dead man-type nozzles, with a flow rate not to exceed 10 gallons-per-minute (38 liters-per-minute), or through close-coupled pressure fueling ports. Where fuel is dispensed from fixed piping systems, the hose cabinet should not extend into the rotor space. The operator should provide a curb or other approved barrier to restrict any servicing vehicles from coming closer than within 10 feet (3 meters) of any helicopter rotating components. If an operator cannot provide a curb or approved barrier, servicing vehicles should be kept 20 feet (6 meters) away from any helicopter rotating components and a trained person should direct the approach and departure of the servicing vehicles.

b. Procedure for Evacuation During Aircraft Servicing. A certificate holder's refueling and oxygen replenishment policies and procedures should include any special considerations for the evacuation of passengers (patients). Operators should consider the following requirements when establishing procedures for evacuation of passengers during helicopter servicing:

(1) The certificate holder should establish specific procedures covering emergency evacuation during rapid refueling for each type of aircraft they operate.

(2) If passengers remain onboard an aircraft during fuel or oxygen servicing, there should be enough qualified people trained in emergency evacuation procedures to evacuate the patients.

(3) A clear area for emergency evacuation of the aircraft should be maintained adjacent to not less than one additional exit.

(4) If rapid fuel and oxygen replenishment operations take place with passengers onboard, the certificate holder should notify the Aircraft Rescue and Fire Fighting (ARFF) operation, if available, to assume a stand-by position near the fueling activity with at least one vehicle. This vehicle should be in position before commencing refueling.

(5) Operators should display all no smoking signs in the cabin(s), and the crewmembers should enforce the no smoking rule during rapid refueling and oxygen replenishment.

CHAPTER 4. TRAINING

4-1. GENERAL. This chapter identifies considerations for training for all helicopter air ambulance (HAA) personnel including flightcrew members, medical personnel, Operations Control Specialists (OCS), ground personnel and maintenance personnel. Emphasis is on training beyond the capabilities normally associated with Title 14 of the Code of Federal Regulations (14 CFR) part 135 operations. Most notably, HAA operations include a training program that explicitly requires well-considered and documented risk analysis and human factors issues.

4-2. HAA PILOT-IN-COMMAND (PIC)/SECOND-IN-COMMAND (SIC) GROUND TRAINING. Examples of ground training are provided in Appendix C of this advisory circular (AC). Following are some recommended HAA-specific curriculum items that are suggested by industry best practices:

a. Ground Training Curriculum.

- (1) Risk analysis procedures (these are required by regulation and described in paragraph 3-4 and Appendix A of this AC).
- (2) Local flying area (LFA) orientations.
- (3) Flight planning and weather minimums (described in paragraph 3-3 of this AC).
- (4) Flightcrew functions and responsibilities (including Crew Resource Management (CRM) as described in paragraph 4-9 of this AC).
- (5) Obstacle recognition and avoidance.
- (6) Aircraft systems variations, such as special electrical systems, navigational radios and instrumentation and their performance characteristics.
- (7) Handling and securing of special medical equipment such as stretchers, isolettes, balloon pumps and ventilators.
- (8) Appropriate restraint of infants, pediatric patients and passengers who may pose a threat to the safety of the aircraft and crew, to include prisoners.
- (9) Hospital heliport operations and procedures.
- (10) Day and night unimproved landing area (scene) operations.
- (11) International operations and programs (if appropriate).
- (12) Bloodborne pathogens, biohazard and infection control, including prevention and control of infectious diseases.
- (13) Refueling procedures and methods to ensure fuel quality.

(14) Inadvertent instrument meteorological conditions (IIMC), whiteout, brownout and flat light conditions (described in paragraph 3-9 of this AC).

(15) HAA-specific equipment training (i.e., night vision goggles (NVG), Helicopter Terrain Awareness and Warning System (HTAWS), radar altimeter, etc.).

4-3. HAA PIC/SIC FLIGHT TRAINING.

a. Use of Simulators.

(1) Helicopter flight simulation training devices (FSTDs) are rapidly becoming more advanced. Some are now capable of full-motion with realistic visual cockpit displays. A growing number of helicopter FSTDs are approved by the Federal Aviation Administration (FAA).

(2) Training in IIMC, flat light, and other special conditions can be enhanced through the use of simulators. Simulators have the capability to decrease visibility and simulate a variety of situations not possible in flight. Simulators can provide realistic training in sudden onset emergencies such as dual engine failures. It is strongly recommended that, where possible, FSTDs should be included in part 135 training and checking activities.

(3) Inspectors should become thoroughly familiar with the types of simulators and simulator practices employed by their operators.

b. Flight Training Curriculum. At a minimum, the following topics should be included in the HAA flight training curriculum. Examples of flight training and checking practices are provided through the inclusion of training material as Appendix C of this AC.

(1) LFA orientation (day/night). LFA ground (and optional flight) training should familiarize pilots with LFA terrain, airspace, air traffic facilities, weather (including seasonal sun glare, icing, fog and convective weather) and available airports, heliports, Landing Zones (LZ) and their respective approaches.

(2) Operations Control Center (OCC) interface and utilization.

(3) Hospital heliport operations and procedures (day/night and multi-aircraft).

(4) Unimproved LZ (off-airport) operations (day/night and multi-aircraft).

(5) Day and night cross-country flight to include cockpit and exterior lighting and forced landing considerations (including use of a searchlight if installed).

(6) Communications, including air-to-ground and flightcrew/medical crew procedures.

c. IIMC Avoidance and Recovery Procedures. Training and checking should emphasize the recognition of circumstances likely to lead to IIMC encounters and encourage the pilot to abandon continued visual flight rules (VFR) flight into deteriorating conditions. IIMC may occur when visual conditions do not allow for the determination of a usable horizon, such as flat light conditions (discussed in paragraph 3-9 of this AC) and night operations over unlit surfaces in

low lighting conditions. These conditions may occur in high ceiling and visibility environments. The result may be a loss of horizontal or surface reference by which the pilot typically controls a helicopter in VFR flight. Without adequate training and checking, these conditions may lead to loss of control that may not be survivable.

(1) All HAA pilots must be trained in basic instrument flying skills to recover from IIMC, including those authorized to conduct instrument flight rules (IFR) operations under part H operations specifications (OpSpecs). Training must also be provided on unplanned transition from an intended VFR flight to emergency IFR operations, which involves a different set of pilot actions, including navigation and operational procedures, interaction with air traffic control (ATC) and CRM.

(2) IIMC training should include identification of a predetermined minimum altitude/airspeed combination which should not be exceeded. If this minimum altitude/airspeed combination cannot be maintained, a diversion to better conditions or a return to the starting base should be the first course of action. Training should emphasize that deteriorating conditions may also dictate a landing short of the destination (even an off-airport precautionary landing) or initiating an emergency transition to IFR as appropriate to the situation. It should be further emphasized that such a decision on the part of the PIC is within the pilot's emergency authority and the pilot will not be subjected to disciplinary action solely based on the transition to IFR or the precautionary diversion or landing.

(3) An oral or written test covering procedures for aircraft handling in flat light, whiteout and brownout conditions, including methods for recognizing and IIMC conditions, is required. (Refer to part 135, § 135.293(a)(9).)

(4) Training and checking for all pilots, whether helicopter instrument rated or not, must include attitude instrument flying, recovery from unusual attitudes and ATC communications. The objective is for non-instrumented rated pilots to demonstrate their ability to be able to recover to visual meteorological conditions (VMC). Pilots should receive training, regardless of their Instrument flying qualifications or lack thereof, so following an IIMC encounter they can maneuver a helicopter from instrument meteorological conditions (IMC) to VMC solely by reference to instruments. Checking of their ability is covered in the flight test required by § 135.293(c).

(5) In the absence of an IFR-certified helicopter, training and checking should include instrument maneuvers appropriate to the installed equipment, the certificate holder's OpSpecs and the operating environment.

(6) For checking, if the aircraft is appropriately equipped and the check is conducted at a location where an instrument landing system (ILS) is operational, an ILS approach should be demonstrated. If unable to conduct an ILS approach, a Global Positioning System (GPS) approach should be demonstrated if the aircraft is equipped with an IFR-approach-capable GPS receiver that is maintained to IFR standards (including a current IFR database) and the check can be conducted where a GPS approach is available. If neither ILS nor GPS procedures can be performed, another type of instrument approach must be performed. Very high frequency (VHF) omnidirectional range station (VOR), automatic direction finder (ADF) and airport surveillance

radar (ASR) approaches are options, depending upon available facilities and equipment. Partial panel operations should be considered for inclusion in checks if attitude and gyroscopic heading information are available from single sources. In the case of a helicopter without gyroscopic instruments, the operator should consult with their principal operations inspector (POI) for alternative training and checking methods.

(7) In the event the certificate holder does not have OpSpecs for night or instrument conditions, the aircraft is not equipped with an attitude reference system, a turn indicator or coordinator, or an attitude gyro, and the operating environment is predominantly VFR, the pilot being checked may not be required to demonstrate a VMC recovery from IIMC. Under these circumstances, it is recommended that the pilot be examined verbally in the IIMC recognition and avoidance techniques developed by the operator.

d. Night Training. Many HAA-associated accidents occur at night. Pilot night proficiency is essential for twenty-four hour HAA operations. While not required by regulations, night operations should be emphasized in flight, ground and simulator training.

(1) Night training should be tailored to the certificate holder's specific requirements and capabilities considering the experience level of their pilots, the area of operations, type of aircraft and installed equipment.

(2) Best practices suggest night flight training should include the use of Night Vision Imaging System (NVIS); the appropriate use of HTAWS and radar altimeters. Appropriate use of these technologies will also contribute to pilot proficiency at night, in IIMC and special conditions.

NOTE: This AC is not intended to suggest training or operating a helicopter in actual IMC conditions without a qualified, competent and proficient pilot, a properly equipped helicopter and an IFR clearance. The purpose of the training described here is to provide pilots with an additional margin of safety when conducting HAA operations.

NOTE: Effective April 22, 2017, all HAA pilots must hold a valid helicopter instrument rating or an Airline Transport Pilot Certificate (ATPC) with a category and class rating not limited to VFR. (Refer to § 135.603.)

4-4. MEDICAL PERSONNEL/CREWMEMBER BRIEFING/TRAINING.

a. Required Medical Crewmember Briefing/Training. As stated in § 135.621(a), the pilot in command (PIC) or other flightcrew member must ensure that all medical personnel receive and complete a HAA medical personnel specific safety briefing prior to each HAA operation in which they participate, or, as authorized by § 135.621(b), have completed the certificate holder's approved medical personnel safety training program within the previous 24 months. There is no grace period associated with this 24-calendar-month training period. This training must cover:

- Physiological aspects of flight;
- Patient loading and unloading;

- Safety in and around the helicopter;
- In-flight emergency procedures;
- Emergency landing procedures;
- Emergency evacuation procedures;
- Efficient and safe communications with the pilot; and
- Differences between day and night operations, if appropriate.

b. Recommended Additional Medical Personnel Training. In addition to these required briefing/training subjects, training in the following topics has been identified through industry best practices as fostering crewmember proficiency and safety:

- External power unit (EPU) door and cart;
- Medical equipment – loading and unloading/securing;
- Oxygen system and outlets;
- Audio panel and headsets;
- Lights and vents;
- Cabin cleaning;
- Emergency locator transmitter (ELT);
- Emergency fuel shutoff; and
- Radios –VHF, FM, 800 megahertz (MHz).

4-5. OCS TRAINING. OCCs are staffed during all hours of HAA operations by one or more OCSs, trained to provide a wide range of operational support for the certificate holder's HAA operations. At a minimum, OCSs are required to communicate with pilots, provide weather briefings, monitor flight progress and participate in the preflight risk analysis completed by the pilot (refer to § 135.617). This does not end their involvement in risk analysis, which is a continuous process until the flight is completed. OCSs must be trained in their duties and responsibilities, including duty-time limitations as developed by the certificate holder. By mirroring training requirements of § 135.619(b) into existing staff members and creating standard operating procedures (SOP) scalable to the size of the operation, it is possible for a small operator, with minimal expense, to increase the safety of their HAA operations.

a. HAA OCS Training. Section 135.619(d) establishes the requirement and § 135.619(f) establishes the minimum training for HAA certificate holders operating 10 or more HAAs. Certificate holders operating fewer than 10 HAAs are encouraged to use the same training in all HAA operations.

(1) Preferably, although not required, HAA OCSs should be trained as helicopter pilots and, ideally, be highly experienced HAA pilots.

(2) Before performing the duties of an OCS, each person must satisfactorily complete the certificate holder's FAA-approved OCS initial training program. Initial training must include a minimum of 80 hours of training on the topics required in § 135.619(f).

(3) Each OCS must complete a minimum of 40 hours of recurrent training, every 12 calendar-months after satisfactory completion of initial training.

b. OCS Prior Experience. A certificate holder may reduce the regulatory requirement of 80 hours of initial training provided the individual has certain prior experience. The training may be reduced as appropriate but not less than a minimum of 40 hours. It is recommended that the certificate holder perform a training needs assessment to determine what training requirements (per § 135.619(f)) may not be needed for all for persons who have obtained, prior to beginning initial training, a total of at least 2 years of experience during the last 5 years in any one or combination of the following areas:

- Military aircraft operations as a pilot, flight navigator or meteorologist;
- Air carrier operations as a pilot, flight engineer (FE), certified aircraft dispatcher or meteorologist; or
- Aircraft operations as an air traffic controller or flight service specialist.

c. Training Requirements. OCS training requirements are specified in § 135.619(f). Other requirements, as determined by the Administrator to ensure safe operations, may be added, depending upon each individual HAA operator's circumstances. In addition to required initial and annual training, it is recommended that recurrent training include carrying out periodic emergency procedure drills. Recurrent training and checking must be accomplished before the end of the 12th calendar-month since the last check was accomplished.

d. Testing. OCSs must pass an FAA-approved knowledge and practical test given by the certificate holder on topics required in § 135.619(f). If an OCS fails to satisfactorily complete recurrent training and checking, within this time, the individual may not perform OCS duties until the training and checking is accomplished. There is no provision for a grace period. Requalification of OCS following a lapse may be accomplished by satisfactorily completing the recurrent training and checking. In the event of a test failure, the OCS retest must be proceeded by retraining in the subject areas missed and retesting should cover all subject areas.

NOTE: Effective April 22, 2016, all certificate holders authorized to conduct HAA operations with 10 or more HAA-capable helicopters assigned to the certificate holder's OpSpec must have an OCC. (Refer to § 135.619.)

4-6. COMMUNICATIONS SPECIALISTS TRAINING. Information on communications specialists and their training is provided in the current edition of AC 120-96, Integration of Operation Control Centers into Helicopter Emergency Medical Services Operations. Communication specialists may be employed by the HAA operator, a hospital, and ambulance dispatch center or local law enforcement entities (e.g., local public safety or 911 dispatchers).

a. Training. There are no regulatory qualifications requirements for communication specialists. Employers should provide sufficient aviation-specific training to permit them to perform their intended functions and to know what their limits of authority may be. Communication specialists not employed by the certificate holder, that provide services through either contract or agreement, must be trained in accordance with the certificate holder's approved training program. It is recommended this training would include portions of the OCS training curriculum described above.

b. Third Party Training Providers. Certificate holders may employ outside training resources to provide consistent training to communication specialists, providing the contractor and their training syllabus are approved by the certificate holder.

4-7. GROUND PERSONNEL TRAINING/ORIENTATION. The FAA recommends that HAA operators develop a training program for hospitals, first-responders and law enforcement personnel that includes:

a. LZ Area Evaluation. LZ area evaluation to include size, surface, suitability of terrain, hazard/obstacle identification and the effects of rotor-wash.

b. Use of Visual Cues. The use of visual cues for positioning and parking the helicopter (e.g., standard hand signals and communications).

c. Methods of Lighting. Methods of lighting night landing zones, ground/vehicle lighting considerations, and discipline related to NVG operations.

d. Safety. Personal safety in and around the helicopter, including an overview of FAA rules and safety measures for the specific helicopters that are operated by the certificate holder.

e. Loading/Unloading with Helicopter Shut Down. Loading and unloading with the helicopter shut down.

f. Loading/Unloading with Helicopter Running. Loading and unloading the helicopter with rotors and/or engine running, including the use of a tail rotor guard or lookout.

g. Emergency Landing Procedures. Emergency landing procedures, such as emergency shut-off procedures, securing equipment, etc.

h. Other Emergency Procedures. Emergency procedures for handling fuel leaks, helicopter fires, fire suppression and other situations requiring an emergency response.

i. Helicopter Evacuation Procedures.

j. Other Procedures. Other procedures for day/night operations into and out of an unimproved landing site.

NOTE: The Aeronautical Information Manual, chapter 10, 10-2-3 provides information that may be helpful in planning outreach training. Additionally, several industry publications are available to provide information on training for LZ operations.

4-8. MAINTENANCE PERSONNEL TRAINING.

a. Training. Maintenance personnel participating in HAA operations should receive training to meet specific needs unique to these operations. This includes the mounting and maintenance of medical equipment, non-aviation radios and other communications equipment and the scheduling and performance of maintenance to facilitate the demands of either scheduled

or non-scheduled HAA operations. Training of maintenance personnel is required in accordance with § 135.433.

b. Supplemental Training. Maintenance personnel should be trained on servicing and maintaining medical oxygen systems and other equipment as required. Training should include biohazard control and mitigation associated with HAA operations.

NOTE: Recurrent training (and its documentation) is recommended for all maintenance personnel in addition to initial training.

4-9. CRM TRAINING. Flightcrews may experience high stress levels in HAA operations. CRM training is intended to prevent inappropriate actions and decisions during periods of stress. HAA operators should implement CRM training that builds effective integration and coordination during routine flight operations as well as including issues such as the use of medical personnel to supplement flightcrew, as appropriate during emergency operations including IIMC recovery, and non-emergency operations including NVG operations and flight into unimproved LZs, etc. Due consideration should be given to the over-riding medical care priorities that medical personnel serve when training medical personnel in aviation related activities. Refer to the current edition of AC 120-51, Crew Resource Management Training.

4-10. AIR MEDICAL RESOURCE MANAGEMENT (AMRM) TRAINING.

a. General. The purpose of an AMRM training program is to create a shared safety culture, between customer management and HAA operator management cooperatively bringing together HAA operators and medical organizations. Clearly defined and consistently implemented operating philosophies, policies, safety culture, best practices and procedures should be reflected in training to create an understanding of authority and responsibility of all levels of the involved personnel. Refer to the current edition of AC 00-64, Air Medical Resource Management, to identify training issues.

b. Shared Training. Aviation and medical management personnel should collaboratively and explicitly define the safety responsibility and authority of managers and subordinates. Shared AMRM training provides a common language and understanding to enable appropriate safety communication, responsibility and authority, within both HAA operators and medical organizations (and others as appropriate). Ideally, AMRM training should not be limited to the classroom but include engagement with high-level decisionmakers, including medical or hospital management.

4-11. JUDGMENT AND DECISIONMAKING TRAINING. Crewmember judgment is the mental process by which the crewmember recognizes, analyzes, and evaluates information about himself or herself, the helicopter and the external environment. Industry best practices recognize that judgment and decisionmaking can be developed and improved with training. Pamphlet DOT/FAA/PM 86 45, Aeronautical Decision Making for Helicopter Pilots, is a recommended tool to improve aeronautical decision-making (ADM).

a. Topics. Decisionmaking training should include topics such as LFA, refueling locations, terrain, local weather patterns, aircraft characteristics and capabilities and medical equipment. Emphasis in training should be placed on identifying and addressing the types of

decisions likely to be required by the specific needs of HAA operations. This includes, for example, training in the decisionmaking process involved when changing weather conditions might dictate a route change or termination of flight.

b. Risk Analysis. Risk analysis is an integral component of the decisionmaking process. It must be trained for, understood and practiced by HAA crewmembers before and during all flight operations.

c. Decisionmaking Training. Emphasizes that the best practices in the industry reflect that the medical condition of the patient should not be a factor in the PIC decision to accept or decline a flight and should not be briefed to the PIC in advance of the decisionmaking process.

d. Management Personnel. Management personnel should participate in the certificate holder's training program. Management personnel should be familiar with the ADM process. Knowledge of appropriate FAA regulations and guidelines related to safe operations is essential. (See Chapter 8.)

e. Human Factors. The operator must effectively address human factors that have the potential to affect HAA operations. (Refer to § 135.330.)

CHAPTER 5. EQUIPMENT

5-1. THE HELICOPTER AIR AMBULANCE (HAA) HELICOPTER. The selection of a suitable HAA helicopter (and its subsequent modification) will include considerations exclusive to the HAA operating environment. An applicant should identify, in their initial application, any specialized flight operations equipment that will be aboard the helicopter(s) used for HAA operations.

a. Weight and Performance of HAAs. An operator should consider the effect of the significant added operating weight associated with even a basic HAA helicopter's mission-specific modifications including equipment such as a Helicopter Terrain Awareness and Warning System (HTAWS), radio altimeter, and Flight Data Monitoring System (FDMS). In addition, weight penalties are associated with an aeromedical interior, medical equipment and supplies, and provision for medical personnel and their personal gear. Equipment such as Night Vision Imaging System (NVIS), satellite communication (SATCOM), position tracking and reporting systems and possibly equipment supporting instrument flight rules (IFR) capability provides additional operational capability but further reduces helicopter payload and performance.

b. Control and Use of HAAs. By regulation (Title 14 of the Code of Federal Regulations (14 CFR) part 135, § 135.25), the certificate holder is required to have control and exclusive use (including maintenance) of at least one aircraft to be used in part 135 service. Helicopters used in HAA operations may be owned or leased by the certificate holder. In the case of leased equipment, the lessor may be the certificate holder's customer (hospital group or community). This common industry practice may introduce operations control complications unless the lease is executed in a manner that transfers operations control unequivocally to the certificate holder. Operators should be on guard against the potential of perceived operations control retention by the lessor. This practice has historically led to undue pressure on the operator during flight risk analysis and flight authorization decisionmaking processes.

5-2. EQUIPMENT REQUIRED BY REGULATION FOR HAA OPERATIONS.

a. Radio Altimeter. A Federal Aviation Administration (FAA)-approved radio altimeter or an FAA-approved device that incorporates a radio altimeter, is required and must be operational unless otherwise authorized in the certificate holder's approved minimum equipment list (MEL). Specifications for radio altimeters under this requirement are in § 135.160. Operators should establish and document procedures to be followed if operations are conducted with an inoperative radio altimeter in accordance with an MEL. Incorporating procedures such as requiring increased ceiling and or visibility and limiting flights where white out, brownout, or encounters with flight light conditions may be possible may mitigate risk. Inoperative equipment should also be addressed as a risk analysis factor as discussed in appendix A of this advisory circular (AC).

NOTE: The FAA may authorize deviations for certain helicopters (maximum gross takeoff weight no greater than 2,950 pounds) unable to incorporate a radio altimeter. (Refer to § 135.160.)

b. HTAWS. An HTAWS that meets the specifications of FAA Technical Standard Order (TSO) C-194 and RTCA DO-309 must be installed and operational in all HAA helicopters. The operator's manuals or other documentation must specify appropriate procedures for the use of this equipment, including the proper flightcrew response to audio and visual warnings. There is a process for operators with HTAWS covered by a deviation under § 21.618 to meet the regulatory requirements of § 135.605. The HTAWS requirement becomes effective on April 24, 2017.

c. FDMS Capable of Recording Flight Performance Data. To meet the requirements of § 135.607, the operator must install an FAA-approved FDMS in each HAA. In this context, "approved FDMS" means only that the installed FDMS be capable of recording "flight performance data" including at minimum: Latitude, Longitude, Barometric Altitude, and Date/time of recording, once per second and have sufficient memory to retain these data over 4 hours of flight time. The FDMS is approved by Supplemental Type Certificate (STC), design review, or field approval, depending upon the complexity of the installation, the interface between the FDMS and other systems installed aboard the aircraft, and that it poses no hazard to other onboard equipment, nor any hazard to occupants. Beyond the minimum parameters, additional parameters recorded by the FDMS are at the discretion of the operator. Retention and use of recorded data is also at the discretion of the Operator. The FDMS requirement becomes effective on April 23, 2018. The FDMS is not to be confused with a flight data recorder (FDR) certified under § 27.1459, though an FDR would be acceptable to meet the FDMS requirement.

(1) The FDMS must operate from the application of electrical power prior to engine start until the removal of electrical power after termination of the flight (refer to § 135.607). The FDMS design should be compliant with Design Assurance Level D (DAL-D) as set out in the latest revisions of both RTCA DO-178 (for software development) and RTCA DO-254 (acceptable airborne electronic hardware development standards). FDMS inspection and maintenance should be conducted in accordance with the manufacturer's instructions for continued airworthiness (ICA). Additional information is in AC 27-1B MG 6, Miscellaneous Guidance (MG) for Emergency Medical Service (EMS) Systems Installations.

(2) The operator determines and maintains the FDMS data stream format and parameter documentation. The operator is responsible for determining:

- Parameters(beyond the minimum direct parameters of latitude, longitude, barometric altitude, and date/time of recording) that are recorded and which are derived from recorded data;
- Latency (how frequently each recorded parameter is recorded);
- Bit resolution of each parameter;
- Operational range of each parameter; and
- Conversion algorithms from digital or analog signal units to engineering units.

(3) Information may be directly recorded or may be deduced from recorded data (e.g., continually updated three dimensional Global Positioning System (GPS) location data may yield ground speed, heading and course being flown and altitude). The FDMS should record digital or analog raw data, images, cockpit voice or ambient audio recordings or any combinations thereof which ideally yield at least the following flight information:

- Location;
- Altitude;
- Heading;
- Speeds (airspeed and groundspeed);
- Pitch, yaw, and roll attitudes and rate of change;
- Engine parameters;
- Main rotor RPM;
- Ambient acoustic data;
- Radio ambient audio; and
- Any other parameter the operator deems necessary (e.g., high definition video recording looking forward including instrument panel and forward cockpit windshield view, intercommunications system (intercom) between pilot and medical crew, communications with air traffic control (ATC), OCS, base operations, first responders at scene, hospital, etc.)

(4) The FDMS should have sufficient non-volatile memory to record flight performance data over the course of an entire flight operation. FDMS data should be retrieved periodically and the resulting information be used for Safety Assurance (SA) programs such as flight operations quality assurance (FOQA) at the discretion of the operator. The recording memory capacity of the FDMS would correlate directly to the maximum data retrieval period.

(5) Though the FDMS is not required to be hardened or crash worthy such as an FDR, it should be able to endure extreme environmental conditions including storage and operational use temperatures, the forces applied during an accident, post-impact water immersion, and to a limited extent, to high heat or fire. Refer to AC 27-1 and RTCA DO-160 (current revisions) for test and analysis options.

d. Additional Equipment Required for HAA Overwater Operations. Except for takeoff and landing, or unless operations specifications (OpSpecs) allow otherwise, overwater operations beyond autorotational distance from the shoreline requires the following special equipment to be aboard the HAA. Refer to the appropriate Title 14 of the Code of Federal Regulations (14 CFR) section. Requirements can be found in §§ 135.168, 135.183 and 136.1.

(1) Approved life preservers, equipped with an approved survivor locator light, must be carried aboard all part 135 helicopters, including HAA, for each occupant. Each occupant must wear a life preserver when the flight operates beyond an autorotational distance from the shoreline. The exception to this requirement is when wearing a life preserver would be inadvisable for medical reasons as determined by medical personnel.

(2) A 406 megahertz (MHz) emergency locator transmitter (ELT), with a 121.5 MHz homing capability and approved batteries must be installed in the HAA. This ELT must meet the TSO and RTCA standards listed in § 135.168(f).

5-3. MEDICAL EQUIPMENT FOR HAA OPERATIONS. Part 135 certificate holders conducting HAA operations will utilize equipment associated with medical transport.

a. HAA Interiors. HAA interiors are typically lined with washable panels, edge sealed to prevent leakage of fluids into interior spaces beneath the subfloor. Interlocking and sealed flame-retardant and moisture-resistant interior panels be designed in accordance with 14 CFR parts 27 or 29 would meet the requirements of an STC.

b. Stretchers (Litters). Stretchers should be designed and FAA-approved for HAA use. Refer to part 27, § 27.561 and part 29, § 29.785 for further information. Restraining devices, including shoulder harnesses, should be available to ensure patient safety.

c. Medical Oxygen Systems. Medical oxygen and nitrous oxide for patient use may be delivered via compressed gas systems consisting of high pressure compressed gas cylinders, regulators, valves, and plumbing; cryogenic liquid oxygen systems consisting of an insulated reservoir tank instead of high pressure compressed gas cylinders and the rest of the downstream equipment mentioned above; and molecular sieve oxygen concentrators. In all cases, the installation must utilize only FAA-approved components installed in accordance with the manufacturer's STC and field approvals as appropriate to the system chosen. Servicing of permanently installed medical oxygen systems should be delegated to appropriately trained flightcrew members or maintenance personnel. Removal, replacement, and securing of portable oxygen systems may be accomplished by appropriately trained medical personnel.

d. Medical Portable Electronic Devices (MPED). MPEDs, such as Automated External Defibrillators (AED), airborne patient medical telemonitoring (APMT) equipment and portable oxygen concentrators (POC), authorized by Special Federal Aviation Regulation (SFAR) 106, should be designed and tested to meet requirements in accordance with the current edition of RTCA/DO 160, section 21, Category M (as referred to in paragraph 1-7 of this AC.) For further information, refer to the current edition of AC 91-21.1, Use of Portable Electronic Devices Aboard Aircraft.

e. Supplemental Lighting System. Standard aircraft lighting may not be sufficient for adequate patient care. Some HAAs may require additional lighting. The cockpit must be shielded from light emitted from the patient area during night operations. Any supplemental lighting must be compatible with an NVIS installation. HAA industry best practices suggest, where possible, installing an emergency lighting system with a self-contained battery pack to allow for continued patient care and emergency egress from the helicopter in the event of a primary electrical failure.

f. Electric Motor-Driven Medical Devices. Medical equipment attached and secured to a mounting inside the HAA should have electric motors thermally protected and isolated against inadvertent overheating to reduce fire hazards. Electrical motors should also be fitted with shielding and filters as necessary to prevent conducted and radiated electromagnetic interference (EMI).

g. Electrical Power Generating Capacity. For each HAA equipped with multiple electrically powered auxiliary systems, an analysis of generating capacity against power consumption should be performed and documented. The operator must be able to meet § 135.159 regulatory requirements.

5-4. RECOMMENDED EQUIPMENT FOR HAA OPERATIONS. Other equipment may also be installed on HAA aircraft such as: a helicopter-approved searchlight, specialized communication equipment for coordination with ground responders, NVIS with STC or manufacturer approved NVIS compatible interior lighting, SATCOM, and aircraft position tracking equipment.

a. Helicopter-Approved Searchlight. Industry best practices are that a HAA should be equipped with a high-powered mounted searchlight manipulated by the pilot, having a minimum traverse of 90 degrees vertical and 180 degrees horizontal and capable of illuminating a landing site. The pilot should be able to fly hands-on with the helicopter flight controls while operating the searchlight.

b. Communications with Hospitals and First Responders. In addition to the radios required for ATC and communication with the Operations Control Center (OCC), a radio capable of air-to-ground communications is recommended to ensure coordination with ground personnel (e.g., hospitals, personnel on the scene, police or fire department).

c. Intercommunications System (intercom). An intercom should be provided for pilots and medical personnel to communicate with each other aboard the helicopter. The intercom should provide for isolation of pilot from crew and crew from pilot, with an over-ride in case of an emergency that either party wishes to advise the other about.

d. Wire Strike Protection System. A wire strike protection system is a recommended safety enhancement modification if it has been type certificated (TC/STC) for installation on the specific make, model, and series (M/M/S) of helicopter.

e. Pyrotechnic Signaling Device(s). Recommended to be aboard in a conspicuously marked location easily accessible to HAA occupants.

5-5. EQUIPMENT INSTALLATION EVALUATION FOR HAA OPERATIONS. Any equipment installed onboard a helicopter should comply with the data in AC-27-1B MG 6 and be installed in accordance with the current edition of AC 43.13-2, Acceptable Methods, Techniques, and Practices—Aircraft Alterations; 14 CFR part 43 and part 135 subpart J.

a. Equipment Installation General Considerations.

(1) Equipment installed in racks should meet the G loading requirements imposed by normal flight and an emergency landing, using approved data provided by the equipment manufacturer. Industry best practices suggest that rack mounting is considered preferable to other mounting approaches, such as attachment to FAA-approved poles or other mounting devices. Medical equipment mounting structures in racks should be installed so that equipment that has been attached to them it may be readily removed to accompany a patient.

(2) Mounting structures attached to the aircraft, regardless of type, should be installed and removed by FAA-authorized personnel. A HAA operator should document instructions for removal and replacement of such equipment. The installation of additional equipment following issuance of a STC or field approval is normally done using instructions and operational supplements. Weight and Balance (W&B) data and ICA should be included. Consider also

including such installed equipment in the aircraft MEL. Medical instruments and equipment attached to mounting structures are considered carry-on baggage for W&B purposes. The operator should ensure medical personnel are adequately trained to securely attach equipment to installed mounting structures to prevent hazards in flight.

(3) The requirements of § 135.91(a)(1)(iv), concerning oxygen for medical use by passengers, requires that all installed equipment, including portable devices, be appropriately secured. The structure(s) supporting this equipment should be designed to restrain loads in accordance to FAA certification requirements. (Refer to AC 27-1B MG 6.)

(4) Any cockpit equipment with self-contained illumination that is added to a previously-approved NVIS-compatible cockpit under an STC must be evaluated. Such new cockpit equipment must be approved with respect to NVIS compatibility and appropriate STC or field approval secured. Consult the principal avionics inspector (PAI) and principal maintenance inspector (PMI) for further details.

b. Installation Evaluation.

(1) Each installation should be evaluated at its time of approval to determine if a mechanic is required to perform installation or if other personnel can be trained for its removal or replacement.

(2) The certificate holder must ensure that installation of any additional equipment is compatible with all previously installed and certificated aircraft systems.

(3) Before returning a helicopter to service after the installation of additional equipment, flight tests may have to be accomplished to determine any interference with avionics, navigation, communications or flight and engine control systems. Such flight tests should be accomplished in visual meteorological conditions (VMC). Tests should include all installed equipment and carry-on medical equipment intended to be used for patient monitoring and care during transport. If any incompatibility cannot be solved by appropriate adjustments to newly installed additional equipment or de-conflicted with pre-existing systems, new equipment may not be operated until compatibility issues are resolved. Results of flight tests verifying non-interference and acceptability should be entered into appropriate permanent records for each helicopter.

NOTE: Medical monitors may be affected by the aircraft's electronic equipment. Therefore, at the time of installation and following maintenance, medical personnel should ensure the calibration and operation of such equipment is in accordance with the manufacturer's instructions, operational tolerances and approved data.

NOTE: Patient life support systems, which include litters/stretchers, incubators or isolettes, balloon pumps, etc., not normally included in the type design of the helicopter should be installed in accordance with the applicable part 43 regulations, AC 27-1B MG6, and FAA-approved data.

c. Medical Portable Electronic Devices (MPED). MPEDs that do not exceed electromagnetic emission levels contained in RTCA/DO 160 section 21, Category M, in all modes of operation (i.e., standby, monitor and/or transient operating conditions, as appropriate), may be used on board aircraft without any further testing by the operator. Equipment tested and found to exceed section 21, Category M emission levels are required to be evaluated for EMI and radio frequency interference (RFI) while mounted in the operator's aircraft. All navigation, communication, engine and flight control systems will be operating in the selected aircraft during the evaluation.

d. Medical Oxygen System. Depending upon the type of medical oxygen system installed (including bottles, lines, connectors, gauges, regulators and other system components), the certificate holder will establish an FAA-accepted method, or adopt a manufacturer's approved method, for its servicing and replenishing. If the method of servicing a medical oxygen system requires the disconnection and reconnection of installed fittings, (other than the removal and replacement of a service port cap) a certificated mechanic must perform the servicing. If the method of oxygen system servicing does not require any of the above operations, the service and replenishment procedure must be documented in an appropriate form and be available to the pilot. Each pilot must be trained and checked in the performance of these medical oxygen servicing and replenishment procedures.

e. Electrical Power. All wiring, electrical components and installation procedures should conform to the requirements of parts 27 or 29, as applicable. An electrical load analysis (ELA) should be performed to preclude overload of the helicopter generating system. The system should provide the pilot with a means of rapidly shedding electrical load in an emergency.

f. Motor-Driven Vacuum/Air Pump. Motors and/or pumps should be installed in accordance with appropriate STCs or other FAA-approved information. Any motor-driven device should be installed so as to preclude contact with any flammable fluid, gas or foreign materials that may cause or be susceptible to heat buildup which could lead to fire. Helicopters should be flight-tested with electric motors running to check for interference.

CHAPTER 6. OPERATIONS CONTROL CENTER (OCC)

6-1. GENERAL. This chapter summarizes regulatory requirements, recommendations and best practices regarding the Operations Control Center (OCC). An OCC is required for operators conducting helicopter air ambulance (HAA) operations with 10 or more HAAs and is recommended for other operators. The OCC requirement becomes effective on April 22, 2016. The current edition of Advisory Circular (AC) 120-96, Integration of Operation Control Centers into Helicopter Emergency Medical Services Operations, provides detailed guidance, including recommendations on establishing the physical layout of an OCC. This chapter provides recommendations to assist HAA operators with identifying best practices for implementing OCCs and operations control procedures. It is intended to help encourage and enable operators without a regulatory requirement to establish and operate an OCC to attain their operational benefit.

6-2. CORE CONCEPTS: OCC AND ENHANCED OPERATIONS CONTROL PROCEDURES. There are three primary concepts from AC 120-96 that define an effective OCC and enhanced operations control procedures:

a. Joint Flight Safety Responsibility. The first concept is joint flight safety responsibility for each HAA flight. Joint flight safety responsibility requires that at least one qualified ground staff member, in addition to the PIC, be actively involved in reviewing the PIC risk analysis in accordance with the required risk analysis program (Title 14 of the Code of Federal Regulations (14 CFR) part 135, § 135.617) and be responsible for monitoring factors affecting flight safety before and during the flight. The utilization of qualified Operations Control Specialists (OCS) on the ground also provides additional support and risk monitoring redundancy for pilots in high workload situations.

b. Written Standard Operating Procedures (SOP). The second concept is a requirement for documented SOPs that are used to guide training and standardize operations performance. Standardization of written Operations Control procedures reflects the same concerns that mandate the use of checklists on the flight deck. SOPs are documented so they can be referenced and performed the same way each time. The detail and scope of this documentation should reflect the size and complexity of each HAA operations. SOPs may be accessed either electronically or via hard copy (refer to Operations Specification (OpSpec) A061, Use of Electronic Flight Bag, for in-flight use of electronic documentation). Regardless, written procedures should be readily available, especially in times of high work load situations such as abnormal or emergency operations.

(1) Though industry is moving towards a less paper-dependent environment, a truly paperless environment has yet to be achieved. A key technology (e.g., a local area network (LAN) or workstation) may fail in conjunction with an emergency, or could even be the cause of emergency or abnormal operations. Technology failures may render electronic access to written SOPs unavailable. Therefore, while standard access to written SOPs may be accomplished electronically, these SOPs may not be available, especially in an emergency situation. Hard copy current written versions of all critical SOPs should be maintained and be readily available for use during abnormal or emergency operations.

(2) The requirement for hard copy Operational Control SOPs therefore mandates that the operator also include the Operations Control SOPs in the version and distribution control SOP for managing other required hard copy documents.

(3) Operators should also develop an SOP to provide for a continual internal process to solicit, obtain, and respond to feedback on SOPs and update these SOPs and ensure the value of training based on them. An SOP is needed to provide for a vehicle to continually receive feedback on procedures, respond to and prioritize feedback and accordingly, update procedures, inform staff of changes to procedures, and train staff on new procedures.

c. Leveraging Technology and Communication. The third core concept of OCCs and enhanced operations control procedures is to leverage technology and communication to enhance safety and efficiency. This includes providing an enhanced level of situational awareness to the pilot in command (PIC), OCS, and other individuals.

(1) **Flight Operations Support.** An OCC is an optimal environment for leveraging technology to support flight operations. An OCC's centralized location can provide economies of scale that make it economically viable to invest in both the information technology (IT) infrastructure and the IT support staff required to support its functions.

(2) **Benefits to HAA Operations.** An OCC can leverage technology to provide communication and safety benefits to HAA operations. For example, an OCC may be able to acquire weather information for currently non-covered locations. This information may come from a variety of weather feeds available at the OCC, including non-aviation sources such as telephone calls.

(3) **Situational Awareness Improvement.** As a result of this leveraging of technology, an OCC can contribute to improving the situational awareness of HAA personnel. This includes receiving and filtering information (including weather as in the example above) and providing inputs for or conducting shift-change and preflight briefings.

(4) **Provision of Situational Awareness Information.** In addition to the regulatory requirements the operator should establish and document procedures to acquire, fuse and provide situational awareness information to the PIC, using the OCC, OCS and other individuals and capabilities as appropriate. This is an example of the use of leveraging technology and communications to reduce risk in HAA operations.

(5) **Shift Change Briefing.** Operators should have a procedure to ensure the explicit provision by the OCS being relieved, of information on current operational and flight conditions, locations and status of all flights transferred to the relieving OCS, with emphasis placed on hazard updates to the pilots. This may include using conference call or other technology to link personnel at remote sites. This is an example of the use of leveraging technology and communications to reduce risk in HAA operations.

6-3. OCS.

a. OCS Requirements. The OCS is a critical component of the overall concept of emphasizing safe HAA operations. An OCS must be trained for a range of capabilities, as set out in paragraph 4-5 of this AC. The OCS must:

- (1) Provide two-way communications with pilots.
- (2) Provide pilots with weather briefings, to include current and forecast weather along a planned route of flight.
- (3) Monitor progress of each HAA flight.
- (4) Ensure pilots have completed all of the required items (as described in § 135.617) on a preflight risk analysis worksheet.
- (5) Acknowledge, in writing, specifying date and time, that a preflight risk analysis worksheet has been accurately completed and that, according to their professional judgment, a flight can be conducted safely (as described in § 135.619(a)(iv)).

b. OCS Recommended Capabilities. It is recommended that an OCS:

- (1) Participate in adjustments to risk analysis as a continuous process throughout a flight while carrying out regulatory-required flight monitoring responsibilities;
- (2) Assist the pilot in mitigating any identified high risk prior to takeoff; and
- (3) Secure management approval of a flight authorization if a predetermined level of individual or total risk is exceeded.

6-4. OCC FACILITIES AND CAPABILITIES. AC 120-96 describes possible OCC facilities and capabilities that can be realized by many different structures and physical configurations, depending on operator requirements. There are many possible alternatives, depending on the size and scope of the HAA operator. The OCC provides a physical location where the OCS and any other personnel can access technologies with the overall objective of being able to assist the PIC.

a. Recommended OCC Facilities. The following hardware and software resources should be considered as best practices for developing an OCC. Refer to AC 120-96 for further explanation and details concerning the following issues:

- (1) Enabling technologies (to include LANs, Internet access, and digital signature capabilities for form completion).
- (2) Aircraft situational displays depicting status of all certificate holder HAA aircraft.
- (3) Aviation weather analysis tools (to include textual, graphical and Geographic Information System (GIS)-enabled).
- (4) Notice to Airmen (NOTAM) tools (both textual and graphical).

(5) Air traffic flow tools (to include temporary flight restrictions, special use airspace, special areas of operation, military operations airspace, high density and congested airspace, warning areas and weather watch boxes).

(6) Communication tools (to include telephones, email, datalink, radio (aircraft and first responders including Voice over Internet Protocol (VoIP) capabilities), satellite communications (SATCOM) and advanced communication consoles).

(7) Non-aviation situational awareness tools such as the Federal Highway Administration (FHWA) Meteorological Assimilation Data Ingest System (MADIS), Internet capable of accessing weather cams, or television capable of receiving cable news channels.

b. Adapting OCC Facilities and Capabilities to Smaller Operators. Smaller (less than 10 HAAs) operators are not required by regulation to have an OCC staffed by OCSs. However, best practices of such operators have provided examples of the use of similar appropriately scaled methods to achieve the same goal.

c. Voluntary Implementation. If an OCC is not required and the operator chooses to voluntarily implement a similar capability or function, the operator's policies and procedures (and details of training specialists in operations control subject matter) should be established and documented by the operators in their General Operations Manuals (GOM) or other permissible forms of documentation. This documentation system must be accepted by the principal operations inspector (POI). The operator should demonstrate that operational control and PIC responsibility and authority is maintained and safety is not compromised through the duties and responsibilities of the individuals staffing that non-regulatory function.

d. Training Requirements. Operations control training of existing staff members should reflect the training requirements of § 135.619(b). Creating SOPs appropriately reflecting the size and complexity of the operation makes it possible for a small operator to increase the safety of their HAA operations with minimal expense.

CHAPTER 7. MANUALS, DOCUMENTATION, AND RECORDS

7-1. GENERAL. Title 14 of the Code of Federal Regulations (14 CFR) part 135 certificate holders conducting helicopter air ambulance (HAA) operations are subject to generally the same documentation and recordkeeping requirements as are other part 135 certificate holders, with a few additions.

7-2. MANUALS AND DOCUMENTATION. Part 135 certificate holders conducting HAA operations are required to compile and maintain Federal Aviation Administration (FAA)-approved procedures for preflight risk analysis (part 135, § 135.617) and visual flight rules (VFR) flight planning (§ 135.615). The following are subject matter areas which, due to either regulatory requirements or industry best practices, should be included in approved/acceptable documentation in a manual (or other accepted format) that goes beyond those required of other part 135 operations. The list below does not relieve the certificate holder from including other items in their operations manual as required.

a. General Operations Manual (GOM). It is recommended that each single-pilot and basic part 135 certificate holder conducting HAA operations, develop a GOM that covers the subject matter contained in §§ 135.23, 135.615, and 135.617. This manual should be available in each helicopter and at each location where flights are initiated.

b. Accident Incident Plan/Post-Accident Incident Plan (AIP/PAIP). All HAA operators, regardless of size, must establish accident and incident notification procedures, to include the local FAA office, National Transportation Safety Board (NTSB) and FAA certificate-holding district office (CHDO) telephone numbers. This is a requirement shared with other part 135 operations. Due to the nature of the distributed base operation generally conducted by HAA operators, this requirement may be somewhat more complex than a response plan for a single base non-HAA part 135 operation. (Refer to § 135.23(d).)

c. Rapid Refueling Procedures. Refueling with the engine(s) running, rotors turning, and/or passengers on board can be hazardous and must be accomplished in accordance with appropriate documented procedures and by trained personnel.

d. Fuel Quality. Due to the nature of HAA operations, many bases are at locations other than airports. It is recommended that operator-developed documentation define a program for determining and maintaining fuel quality. The operator may choose to procure fuel from commercial fixed base operator sources and/or maintain fuel quality within their own system throughout the chain of custody from receipt (from the distributor) to delivery (into the helicopter). It is recommended that the operator consult International Civil Aviation Organization (ICAO) Doc 9977 AN/489 Manual on Civil Aviation Jet Fuel Supply and the current edition of Advisory Circular (AC) 150/5230-4, Aircraft Fuel Storage, Handling, and Dispensing on Airports.

e. Procedures for Medical Equipment Installation and Removal. Removal and replacement of medical equipment items may have to be performed on a frequent basis. If the operation is simple, does not require tools, and can be done in accordance with approved data and procedures contained in the operator's manual, any person trained by the certificate holder

may be authorized to remove or replace such equipment. If the operator chooses this option, they must include this training in their FAA-approved training and checking program. The HAA operator must document who is authorized to remove and replace equipment on its helicopters. If personnel other than certified mechanics will be removing or replacing equipment, they must do so in accordance with documented instructions and training provided.

f. Flight Authorization and Flight Locating Procedures and Operations Control Personnel Duties and Responsibilities. These should be well considered and be documented in the operations manual. For those operators with an Operations Control Center (OCC), a description of the duties and responsibilities of Operations Control Specialists (OCS) should appear in documentation (refer to § 135.619(c)). Operators not establishing an OCC should document procedures for comparable functions.

g. Local Flying Area (LFA) Documentation. Procedures for developing LFAs should be documented in accordance with § 135.611(a)(2). If any LFAs are proposed and accepted, a list of LFAs and a description of the examination that is given to pilots by the certificate holder enabling the use of alternative minima in these LFAs must be provided to the principal operations inspector (POI) for acceptance. (Refer to § 135.609 and Operations Specification (OpSpec) A021, Helicopter Air Ambulance Operations.)

h. Instrument Flight Rules (IFR) Operating Procedures. The FAA intends to facilitate use of the IFR system by HAA operations through developing approaches and departures to and from heliports that are not served by weather reporting and in accordance with Instrument Approach Procedures (IAP) and departure procedures Standard Instrument Departures (SID) and Obstacle Departure Procedures (ODP) that are developed specifically to serve these heliports. Certificate holders should document procedures for IFR operations at locations without weather reporting (refer to § 135.611). The operator should document procedures for IFR operations using publicly available published IAPs or per privately developed, FAA approved special instrument procedures, point in space (PinS) approach procedures and SIDs/ODPs.

i. VFR Flight Planning Procedures. VFR flight planning procedures must, by regulation, be documented in accordance with § 135.615(d.) As part of the VFR planning process, operators must document their procedures for determining and documenting the highest obstacles and minimum obstacle clearance altitudes along intended routes of flight (including any contingency routes) prior to departure.

j. FAA-Approved Preflight Risk Analysis Procedures. Risk analysis procedures must be documented in accordance with § 135.617. These procedures are discussed in paragraph 3-4 and Appendix A of this AC.

7-3. RECORDS. Part 135 certificate holders conducting HAA operations are subject to recordkeeping requirements above those required of other part 135 operators not engaged in such operations. Records required by § 135.63 should be kept at an operator's principal business office or other location(s) approved by the Administrator.

a. Pilot Training Records.

(1) **LFA(s) Familiarity Verifications.** A record of the 12-month local area demonstration or examination given to each pilot for each LFA assigned. (Refer to § 135.609.)

b. Non-Pilot Training Records. Also, see Chapter 4, Training Program.

(1) **Preflight Risk Analysis Worksheets.** Preflight risk analysis worksheets completed by pilots and OCS in compliance with § 135.617 are subsequently maintained in compliance with §§ 135.617 and 135.619.

(2) **OCS.** Training records are kept at least for the duration of that individual's employment and for 90 days thereafter. Training records are required by § 135.619(e) to include a chronological log for each course, including the number of hours and the examination dates and results as well as copies of such examinations. Development of a record of OCS duty times would facilitate tracking.

(3) **Maintenance Personnel.** A recordkeeping system should be used allowing supplemental training to be verified and tracked.

(4) **Medical Personnel.** Each HAA operator must maintain a record of training for each medical crewmember that contains the individual's name, the most recent training completion date and a description, copy or reference to training materials used to meet the training requirement. This must be maintained for 24 calendar-months following the individual's completion of training.

c. Administrative Records.

(1) **OCS Personnel.** OCS personnel are among those employees for whom drug and alcohol testing program records must be maintained in accordance with 14 CFR part 120, §§ 120.105 and 120.215.

(2) **Timekeeping.** Each operator must maintain flight time and duty records for flightcrews. It is recommended that it do the same for OCS personnel to demonstrate compliance with duty time requirements.

CHAPTER 8. SAFETY

8-1. GENERAL. This chapter is intended to make current and potential operators aware of considerations underlying the safety culture that is central to best practices throughout helicopter air ambulance (HAA) operations. An effective safety program should be developed considering all aspects of the operator's policies and procedures essential to the safe completion of a HAA flight. Best safety culture practices, even where they are not an explicit part of the regulations, facilitate compliance and enhance safety. Examples of ways to foster the safety culture are presented in greater detail in Appendix B of this advisory circular (AC).

8-2. SAFETY CONSIDERATIONS FOR HAA OPERATIONS.

a. Safety Commitment. Commitment to safety should start at the top of an organization. The single most important element of a successful safety program is the commitment of senior management. Safety cannot be dictated; it should be practiced. Managers should lead by example and display a safety-conscious attitude including being involved in safety activities. Operators should conduct regular base safety meetings for all affected base and flight personnel.

b. Safety Management System (SMS). Establishment of an effective SMS helps implement a safety culture to address safety considerations unique to HAA operations. Examples of the use of a SMS are provided in Appendix B of this document.

c. Safety Personnel. The HAA operator should designate a safety officer. This individual should be familiar with each aspect of an HAA operation with particular emphasis on safety requirements unique to helicopters. This individual should plan, organize and disseminate information about the safety program to all involved persons. The safety officer should make an effort to reach out to relevant helicopter information sources and organizations such as the International Helicopter Safety Team (IHST), U.S. Helicopter Safety Team (USHST), and Helicopter Association International (HAI) and carefully review the wide range of fact sheets and toolkits available for applicability to their own operations.

8-3. ROLE OF COMPANY PHILOSOPHY AND EXECUTIVE/SENIOR MANAGEMENT.

a. Management Commitment. The regulatory requirement for some HAA operators to establish an Operations Control Center (OCC) (and the recommendation that those not so required carry out OCC functions) is likely to require the commitment of management to be effective. Many existing communication centers have evolved and operated mostly autonomously since their inception. HAA operators may experience difficulty transitioning from the previously autonomous communication centers as an OCC comes online. Management should plan to overcome these issues through education and communication.

b. Philosophy. It is important that an HAA operator's entire organization embrace and promote a cohesive operational philosophy that provides direction for an OCC (or its functions) and the enhanced operations control procedures described in this AC. The instillation of a company philosophy that enhanced flight operations described in this AC are a team effort. They are not simply a matter of a flightcrew receiving basic flight request information and then it being the flightcrew's responsibility to complete the flight.

8-4. EMERGENCY OPERATIONS. The longer that an OCC and enhanced operations control procedures described in this AC are used, the more the organization relies upon their availability. This may result in increasing impact on the ability of the organization to continue functioning if these are interrupted.

a. Documentation. It is recommended that HAA operators prepare emergency procedures that most effectively leverage resources available to the operator, including the OCC. This will include, but may not be limited to those procedures documented by the applicable Accident Incident Plan/Post-Accident Incident Plan (AIP/PAIP). Such procedures should be prepared to provide guidance on how to carry out HAA operations in emergency or degraded capability situations and to manage the partial or total loss of critical capabilities such as OCC and enhanced operations control functions.

b. Training and Drills. It is recommended that an HAA operator conduct regular refresher training and drills to maintain the organization's ability to follow these procedures. Drills should be conducted annually at minimum; more often is preferred.

APPENDIX A. SAMPLE RISK ANALYSIS TOOLS

A-1. PURPOSE OF THIS APPENDIX. The information in this appendix is provided to assist in developing a risk analysis process. It provides examples of approaches that may be used by a helicopter air ambulance (HAA) operator to assess, mitigate, and manage risk. Additional information on risk analysis management can be found in the current edition of Advisory Circular (AC) 120-92, Safety Management Systems for Aviation Service Providers.

a. Background. Title 14 of the Code of Federal Regulations (14 CFR) part 135, § 135.617 requires preflight risk analysis to be conducted as part of the overall risk analysis and, where applicable, be supported by an operator's Operations Control Center (OCC). These requirements should be implemented within a broader framework of organizational systems, including policies, procedures, training and supervision that have been developed based on assessment of day-to-day HAA operational risks.

b. Risk Assessment. The risk assessment process should produce a quantitative result. The process involves identifying hazards associated with a proposed operation and assessing risks associated with each hazard. After risks are assessed, risk mitigation strategies can be identified, developed and implemented. If mitigations will not reduce risk to an acceptable level, a flight should not be authorized.

c. Risk Analysis Components. Risk analysis has two components that are assessed: severity (what is the worst probable outcome) and likelihood (of occurrence). Severity refers to the consequences of an event resulting from the hazard. Likelihood is an estimate of how likely the event is to occur. If the likelihood of an event is estimated to be high, and the consequences potentially severe, the risk analysis would indicate that the flight should not be operated until the identified hazards are eliminated or suitable mitigations have reduced the risk to an acceptable level.

A-2. SEVERITY AND LIKELIHOOD CRITERIA. This appendix provides some examples of one effective tool that has been used by several HAA operators and is intended to be functional for everyday operations without being cumbersome. As throughout the AC, the focus of this appendix is on the results it yields to inform regulatory required actions and it is not intended to prescribe the use of a particular methodology of process. The definitions and design of the final matrix is left to the HAA operator. The definitions of each level of severity and likelihood will be expressed in terms realistic for the individual operational environment and operator's profile. This ensures the relevance of decision tools to the operator's specific needs. An example of severity and likelihood definitions is shown in the table below.

FIGURE A-1. SAMPLE SEVERITY AND LIKELIHOOD CRITERIA

Severity of Consequences			Likelihood of Occurrence		
Severity Level	Definition	Value	Likelihood Level	Definition	Value
Catastrophic	Equipment destroyed, multiple deaths	5	Frequent	Likely to occur many times	5
Hazardous	Large reduction in safety margins, physical distress or a workload such that operators cannot be relied upon to perform their tasks accurately or completely. Serious injury or death. Major equipment damage.	4	Occasional	Likely to occur sometimes	4
Major	Significant reduction in safety margins, reduction in the ability of operators to cope with adverse operating conditions as a result of an increase in workload, or as result of conditions impairing their efficiency. Serious incident. Injury to persons.	3	Remote	Unlikely, but possible to occur	3
Minor	Nuisance. Operating limitations. Use of emergency procedures. Minor incident.	2	Improbable	Very unlikely to occur	2
Negligible	Little consequence	1	Extremely Improbable	Almost inconceivable that the event will occur	1

A-3. RISK ACCEPTANCE.

a. Risk Acceptance. In the development of risk analysis criteria, HAA operators are expected to develop risk acceptance procedures, including: acceptance criteria and designation of authority/responsibility for decisionmaking.

b. Acceptability of Risk. The acceptability of risk can be evaluated using a risk matrix such as those illustrated in Figure A-2. Figure A-3 shows areas with an alphanumeric scale and is an example of how risk matrices may be color-coded: unacceptable (red), acceptable with mitigation (yellow) and acceptable (green).

(1) Unacceptable (Red). Where combinations of severity and likelihood cause risk to fall into the red area, the risk would be assessed as unacceptable. A flight should not be authorized under unacceptable conditions until further controls are developed which eliminate the associated hazard or which would control the factors that lead to higher risk likelihood or severity.

(2) Acceptable with Mitigation (Yellow). When the risk analysis falls into the yellow area, risk may be accepted under defined conditions. Risk mitigation may also include consideration of alternate routes/destinations. A decision to initiate an operation should be elevated to a person responsible for Operational Control decisionmaking prior to conducting the flight. For example, landings and takeoffs at high altitude or high density altitude Landing Zones (LZ) present risks resulting from marginal aircraft performance. Risk mitigation could include load reduction or selecting a LZ at a lower altitude where aircraft performance would not be affected as significantly.

(3) Acceptable (Green). Where the assessed risk falls into the green area, it may be accepted without further action and the flight dispatched. The objective should always be to reduce risk to as low as practicable regardless of whether or not the analysis shows that it can be initially accepted.

A-4. SAFETY RISK MATRIX EXAMPLES. The operator should have written policies that define (in numerical terms) acceptable levels of risk, procedures for determining risk acceptability and steps to be taken for a given level of assessed risk, including risk control strategies. § 135.617 requires HAA operators have a documented procedure for elevating the management level required for flight approval when risk exceeds predetermined levels.

FIGURE A-2. SAMPLE “STOP LIGHT” DECISIONMAKING MATRIX

Severity ↑ Likelihood	←		Higher Lower		→
↑ More Less				Unacceptable	
		Acceptable with Mitigation			
		Acceptable			

FIGURE A-3. SAMPLE RISK LIKELIHOOD/RISK SEVERITY MATRIX

Risk		Risk Severity				
		Catastrophic A	Hazardous B	Major C	Minor D	Negligible E
Frequent	5	5A	5B	5C	5D	5E
Occasional	4	4A	4B	4C	4D	4E
Rare	3	3A	3B	3C	3D	3E
Improbable	2	2A	2B	2C	2D	2E
Extremely Improbable	1	1A	1B	1C	1D	1E

NOTE: The direction of higher scales on a matrix to represent the direction of likelihood and severity are at the discretion of the organization.

A-5. RISK ANALYSIS MATRIX EXAMPLE. The definitions and design of a risk analysis matrix is left to the HAA operator. This ensures each of the operator’s decision tools is relevant to its specific needs and requirements. An example of a two-sided paper form used by one HAA operator is shown in two figures below. Note that the numbers associated with each option do not represent universal best practices, but rather represent an analysis of their meaning for that specific operator. Not only the value assigned to each factor, but the factors selected, reflect the operator’s needs. For example, as in this example, an operator in an inland area would not have to consider quantification of overwater flights, while one operating on an island would have to do so.

FIGURE A-4. SAMPLE RISK ASSESSMENT MATRIX SHOWING QUANTIFICATION OF FACTORS (FIRST PAGE OF A TWO-PAGE FORM)

RISK ASSESSMENT WORKSHEET "SHORT FORM"			
Pilot:	_____

APPENDIX B. SAFETY MANAGEMENT SYSTEMS (SMS)

B-1. PURPOSE OF THIS APPENDIX. The information in this appendix is provided to give a helicopter air ambulance (HAA) operator information concerning the current state of safety management through an overview of safety management systems (SMS). Additional information and resources on SMS can be found in the current edition of Advisory Circular (AC) 120-92, Safety Management Systems for Aviation Service Providers. The Federal Aviation Administration's (FAA) SMS Program Office (SMSPO) provides tools to assist with implementation of the SMS Voluntary Program (SMSVP). These are intended for use by operators to achieve compliance with the safety assessment requirements of Title 14 of the Code of Federal Regulations (14 CFR) part 135, § 135.617 through implementing a formal SMS within their organization. The SMSPO can be contacted at the following Web link: http://www.faa.gov/about/office_org/headquarters_offices/avs/offices/afs/afs900/sms/.

B-2. OVERVIEW. One of the primary goals of an effective SMS is the development of a mature and positive safety culture. Internal and external audits provide assurance that processes are working as designed and continuing to be effective. While it is possible to have a positive safety culture without a formal SMS, a strong safety culture can be fostered by the implementation of an effective SMS. The constant attention, commitment, and visible involvement provided by all levels of management, combined with continuing data analysis, Safety Assurance (SA) activities and daily application of risk analysis and control techniques drive the organization toward safety culture maturity.

a. Confidential Employee Reporting Systems. Are essential components in assuring safety. They provide employee feedback for identifying new hazards and revising procedures.

b. Safety Management is a Learned Skill. Organizations do not simply adopt a software program or a set of posters and buzzwords, attend an hour of slide presentations and instantly install an effective SMS. As with any skill, it takes time, practice, repetition, the appropriate attitudinal approach and good coaching.

c. The Safety Culture Matures as Safety Management Skills are Learned and Practiced. The safety culture becomes second nature across the entire organization as trust builds and the organization functions as a team. The mature safety culture should have the following conditions to flourish.

(1) Openness. The organization encourages and even rewards individuals for providing essential safety-related information which will improve the operation.

(2) Justness. The organization takes a proactive approach toward error disclosure yet demands accountability on the part of employees and management alike. The organization engages in identification of systemic errors through root cause analysis and implements preventative corrective action. It exhibits intolerance of undesirable behavior (i.e., recklessness and willful disregard for established procedures).

(3) Involvement of All Levels of Management. This is demonstrated by:

- Formal risk analysis and resource allocation, as needed to assure mitigation of high consequence, high probability risks;
- Management action beyond rhetoric, actively involved in the decisionmaking processes and participate in safety activities; and
- Strong SA, combined with safety data analysis processes, yielding information, are used to drive risk reduction. An informed organization can take appropriate action to prevent accidents.

(4) Training. This includes training in threat recognition, error management and SMS, SA and Safety Risk Management (SRM) techniques.

(5) Flexibility. The organization uses information effectively to adjust and change in an effort to reduce risk. All aspects of the organization are under constant review and adjustment to meet changing demands.

(6) Learning. The organization learns from its own failures and those of similar operations. The organization uses acquired data to feed analysis processes, which yield information that can be, and is, acted upon to improve safety. Organizational behavior is modified accordingly. Actual practices are based upon accurate and validated information.

d. Accountability. To foster the development of a mature organization with a positive safety culture, an accountable executive must be in place.

(1) The accountable executive is the person who is the final authority over operations, controls, financial and human resources and retains ultimate responsibility for safety performance of the operation.

(2) All of the management staff, at all levels, should convey, enhance and emphasize the organization's safety policy through exemplifying the policy in their daily work and in their one-on-one leadership styles. Decisionmaking should be kept at the lowest level appropriate to the complexity and criticality of the decision. Line managers are the people that own the process. They are in the best position to make appropriate changes. Senior management, including the accountable executive, should monitor actions and provide guidance.

B-3. SAFETY MANAGEMENT SYSTEM (SMS) TOOLS.

a. SMS. The FAA has developed tools for implementing a SMS that are scalable and customizable to operators' size, scope and environment. Two key components of a SMS are SRM and SA. Refer to the current edition of FAA Order 8040.4, Safety Risk Management Policy, for more information. An operator that implements safety management practices using a SMS will have these components integrated into its operations. While current regulations do not require implementation of an SMS, voluntary implementation is encouraged.

b. Risk Analysis. Risk analysis is how an operator provides each pilot-in-command (PIC), Operations Control Specialist (OCS) and others involved in the decisionmaking process with a shared set of documented processes that have been the subject of training to identify conditions (hazards), which if not addressed could foreseeably cause an aircraft accident. This allows an

3/26/15

AC 135-14B
Appendix B

informed process to reduce associated risks by implementing appropriate processes and controls. Risk analyses should also be performed under the following conditions:

- (1) Implementation of new systems.
- (2) Revision of existing systems.
- (3) Development of operational procedures.
- (4) Identification of hazards or ineffective risk controls through audits conducted through SA processes.

c. Systems.

(1) In the context of this AC, “systems” are limited to those processes and their associated personnel, facilities, tools, documentation and other resources that are needed to accomplish HAA-related functions.

(2) Every part 135 operator has a number of aviation-related “systems” such as flight operations, maintenance and inspection (frequently called “technical operations”), operational control and dispatch, medical and ground operations. Within these systems, many lower level processes and ancillary systems exist, such as training, fueling, biohazard decontamination, individual station operations and others.

d. Changes to Operations.

(1) Changes to a HAA operators operation could include the addition of new routes, opening or closing of line stations, adding or changing contractual arrangements for services, the addition of new aircraft types or major modifications to existing aircraft, addition of different types of operations such as night vision goggles (NVG) usage or any one of many different types of operations.

(2) Any of these additions or changes would trigger the use of an SRM process to determine if new hazards appear that would require incorporation of mitigations to reduce risk. In many, if not most, cases, those controls will entail revision or addition of procedures and training for personnel engaged in the operation of the systems. For example, if a HAA certificate holder intends to implement NVG operations, they will need to organize their flight operations, maintenance, training and operational control systems to comply with the applicable regulations and guidance to ensure the NVGs are safely integrated into operations. They will also need to develop and document procedures for employees involved in those systems’ activities.

(3) In most cases, these procedures will be documented in the service provider’s manual system. The baseline for determining acceptable levels of safety for all service providers should be the existing regulatory standards, as applicable. Some mitigations and changes to the operation may require approval or acceptance by the FAA. The SA component provides processes for validation of the organizational processes and effectiveness of risk controls, once they have been implemented as the result of a risk analysis.

APPENDIX C. HAA OPERATOR PILOT TRAINING PROGRAM AND CHECKING EXAMPLES

C-1. GENERAL. This appendix addresses, by providing examples, recommended approaches to the thorough ground and flight training and checking essential in the preparation of a pilot to safely assume the duties of a pilot in command (PIC) of a helicopter air ambulance (HAA). As in the other appendices, these are included as examples rather than being prescribed as an optimal solution. Following are some of the subjects that best practices of HAA operators have indicated should be addressed.

C-2. PILOT GROUND TRAINING – SAMPLE CURRICULUM OUTLINE. The focus of this curriculum is to outline topics specific to HAA operations.

A. Airman:

1. PIC Responsibility.
2. PIC Authority.
3. Flight and Duty Time.

B. General:

1. Definitions.
2. Hours of Operation.
3. Authorized Passengers.
4. Infection Control.
5. Cameras.

C. Preflight/Departure:

1. Visual Flight Rules (VFR) Flight Planning.
2. Base Flight Planning Documents and Material.
3. Weather Minimums – General.
4. Weather Minimums – Area of Operations Considerations.
5. Minimum Safe Cruising Altitudes (Operations Specification (OpSpec) A021).
6. Operations in High Wind Conditions.
7. Wind Requirements.
8. Local Flying Areas (LFAs).
9. LFA Pilot Testing/Examination Procedure.
10. Use of (Night Vision Imaging System (NVIS)) aided Minimums.
12. Weather.
13. Turndowns by Other Operators (and identifications of reason).
14. Routes of Flight - Single-Engine Helicopters.
15. Instrument Flight Rules (IFR) Operations (HAA-Specific Rules).

D. Operations Control Center (OCC):

1. Risk Matrix.

E. Refueling:

1. Engine(s) Off/Rotors Stopped.
2. Helicopter Rapid Refueling (HRR).

3/26/15

AC 135-14B
Appendix C

- F. Safety Briefing of Passengers/Medical Crew Members.
- G. Initial Medical Crewmember Training:
 - 1. General.
 - 2. Training Program Contents/Requirements.
- H. Crew Resource Management (CRM):
 - 1. Crew Concept.
 - 2. Pilot in Command (PIC).
 - 3. Medical Crew.
- I. Flightcrew Member Duties:
 - 1. Pre-Launch Walk-Around.
 - 2. Sterile Cockpit.
 - 3. Engine Start.
 - 5. Takeoff.
 - 6. En Route/Cruise.
 - 7. Before Landing (Prior to 2-Minute Estimated Time of Arrival (ETA)).
 - 8. Arrival at the Intended Point of Landing.
 - 9. Crew Callouts.
 - 10. Aircraft Emergencies.
- J. Crew Change:
 - 1. Crew Change Operational Briefing Subjects.
 - 2. Safety Precautions.
- K. Patient Safety:
 - 1. Loading and Unloading (engines running/secured).
 - 2. Children/Infants.
- L. Use of Seat Belts and Restraints:
 - 1. Seat Belts and Shoulder Harnesses.
 - 2. Infants and Pediatric Patients.
 - 3. Aircraft Doors.
- M. En Route:
 - 1. Flight Plans and Flight Locating.
 - 2. Position Reports.
 - 3. Remote Area Communications.
 - 4. Obstacles (including Wind Turbine Farms Wake Turbulence).
- N. Arrival:
 - 1. Landing Site Requirements.
 - 2. Unimproved Landing Sites.
- O. Equipment Familiarization (Securing, Storage, Weight and Balance (W&B), Loading):
 - 1. Stretchers.
 - 2. Isolettes.
 - 3. Portable O₂.

3/26/15

AC 135-14B
Appendix C

4. Balloon Pumps.
 5. Ventilators.
 6. Miscellaneous Equipment.
- P. Emergency Procedures:
1. Emergency Evacuation Duties.
 2. Hazardous Material Operations.
- Q. Hazardous Patient Transport.
- R. Public Relations Events:
1. Crew Duties – PR Events.
 2. Landing Zone (LZ) Safety and Security.

C-3. PILOT FLIGHT TRAINING – SAMPLE CURRICULUM OUTLINE.

- A. Module 1:
1. Preflight Procedures:
 - a. Med Crew Briefing.
 - b. Noise Abatement.
 - c. Hover/Ground Taxi Operations.
 2. Takeoff and Departure Phase:
 - a. Normal/Crosswind.
 - b. Sidestep.
 - c. Maximum Performance.
 - d. PC2 (If Applicable).
 3. Cruise:
 - a. Navigation.
 - b. Communication.
 - c. Severe Weather Avoidance.
 - d. Maintaining Situational Awareness.
 - e. Helicopter Terrain Awareness and Warning System (HTAWS).
 4. Approach and Landing:
 - a. High Reconnaissance.
 - b. Low Reconnaissance.
 - c. Ground/Hazard Recognition.
 - d. Normal/Crosswind.
 - e. Sidestep.
 - f. Confined Area/Steep Approach.
 - g. PC2 (if applicable).
 - h. Special Conditions (including Flat Light/Brownout/Whiteout Ops and Multi-Aircraft Situations).
 5. Emergency and Abnormal Situations.
 6. Post-Flight Procedures:
 - a. Crew Debriefing.
 - b. Post-Flight Inspection.

- c. Cleaning/Decontamination of Aircraft and Equipment (biohazards).
- d. Servicing O₂ Systems.

C-4. EXAMPLE OF COMPETENCY-PROFICIENCY CHECK EVALUATION SHEET FOR HAA PIC.

§ 135.609 – VFR Ceiling And Visibility Requirements For Class G Airspace.

Search FAR/AIM:

FAR/AIM > Federal Aviation Regulations > PART 135—OPERATING REQUIREMENTS: COMMUTER AND ON DEMAND OPERATIONS AND RULES GOVERNING PERSONS ON BOARD SUCH AIRCRAFT > Subpart L—Helicopter Air Ambulance Equipment, Operations, and Training Requirements > § 135.609 – VFR ceiling and visibility requirements for Class G airspace.

§ 135.609 – VFR ceiling and visibility requirements for Class G airspace.

[Doc. No. FAA-2010-0982, 79 FR 9975, Feb. 21, 2014; Amdt. 135-129A, 79 FR 41126, July 15, 2014]

(a) Unless otherwise specified in the certificate holder's operations specifications, when conducting VFR helicopter air ambulance operations in Class G airspace, the weather minimums in the following table apply:

Category	Day		Night		Night (with an Approved GPS Over Display)	
	CEILING	HEIGHT VISIBILITY	CEILING	HEIGHT VISIBILITY	CEILING	HEIGHT VISIBILITY
Communications (no) (Flying area)	1000	1000	1000	1000	1000	1000
Communications (no) (Local flying area)	1000	1000	1000	1000	1000	1000
Communications (no) (Flying area)	1000	1000	1000	1000	1000	1000
Communications (no) (Local flying area)	1000	1000	1000	1000	1000	1000

(b) A certificate holder may designate local flying areas in a manner acceptable to the Administrator, that must—

- (1) Not exceed 50 nautical miles in any direction from each designated location;
- (2) Take into account obstacles and terrain features that are easily identifiable by the pilot in command and from which the pilot in command may visually determine a position; and
- (3) Take into account the operating environment and capabilities of the certificate holder's helicopters.

(c) A pilot must demonstrate a level of familiarity with the local flying area by passing an examination given by the certificate holder within the 12 calendar months prior to using the local flying area.

Subject: SEQR review input

Dear Mr. Thomas,

Thank you for the opportunity to give an opinion regarding the MVHS hospital project & the SEQR review process.

My husband and I live just off Oneida Square and consider ourselves as long-term "downtown" residents.

We are adamantly opposed to the siting of the new hospital downtown. The city can't afford it. It is a pathetically obvious ploy to acquire parking for the auditorium and potential U center. St. Luke's was the original and correct site.

I am attaching a document that explains just why this process is being so badly handled. You have seen this

document before. Please read it. I know it is long. It is a beautifully thought out piece of reasoning and anyone who cares for our city should take this to heart. Mr. Montecalvo is a retired administrative judge for the NYS department of the environment. It is safe to say he knows what he is talking about.

If you have any conscience, exercise it now. Help stop this ill-considered debacle in its tracks.

Sincerely,
Marcia Menuez-Commerford

City of Utica Planning Board
1 Kennedy Plaza
Utica, NY 13502
Attention: Mr. Brian Thomas, Commissioner
City of Utica, Department of Urban & Economic Development
Ref: Draft Scoping Document, MVHS Proposed Downtown Hospital

Dear City of Utica Planning Board:

This letter is in response to the Utica Planning Board's request for public comment on the above-referenced Draft Scoping document. As detailed below, the Draft Scope contains incorrect and misleading statements, omits relevant information, and dismisses or fails to mention the need to develop certain topics in the Environmental Impact Statement (EIS). Without correction and further definition in the Final Scope, the EIS will provide involved agencies with an inaccurate, misleading, and incomplete picture of the proposed project upon which to base their SEQR findings "that consistent with social, economic and other essential considerations, to the maximum extent practicable, adverse environmental effects revealed in the environmental impact statement process will be minimized or avoided." (Environmental Conservation Law 8-0109 (8)). To ease reference, the discussion below applies the labels found in the Draft Scope.

Section 1.2 Project Purpose

(A) The Applicant failed to identify the purpose(s) to be served by locating its project in Downtown Utica as opposed to the other sites it considered. The public has been told numerous times that Mohawk Valley EDGE used the Applicant's criteria to produce the site selection study upon which the Applicant's choice of the Downtown location was based. That study is still secret, so the public still does not know the Applicant's criteria. Applicant's spokesperson, Mr. Scholefield,

has advised that the site selection study would be made public as part of the SEQR process (eg., video at the 20:00 mark found at [Http://Www.Uticaod.Com/News/20180509/Compassion-Coalition-Mvhs-Deal-Unclear](http://www.Uticaod.Com/News/20180509/Compassion-Coalition-Mvhs-Deal-Unclear)). That time has now arrived and the siting study should be included in the EIS as an appendix.

Montecalvo to Planning Board 6/7/2018 Page 2

(B) Page 3 of the Draft Scope incorrectly states that “[t]he new MVHS IHC and hospital will replace the St. Luke’s and SEMC campuses” and “consolidate patient services to one campus.” As acknowledged elsewhere in the Draft Scope, MVHS will retain certain patient services at both St. Luke’s and SEMC campuses. Not disclosed is MVHS’ retention of the 202-bed skilled nursing facility (formerly called the St. Luke’s Home) on the St. Luke’s Campus. Although some functions from two buildings will be combined into a new building at MVHS IHC, significant patient services will be retained at the old sites, making the characterization of the project quoted above incorrect and misleading. There is no replacement of the SEMC and St. Luke’s Campuses. Rather, the MVHS IHC Downtown campus is being added to the Applicant’s responsibilities, potentially threatening its financial stability.

(C) The Applicant claims existence of a “growing demand for healthcare due to the rapidly increasing and aging population in this region.” Applicant needs to substantiate this claim with actual numbers of people (not percentages). US Census statistics indicate that regional population continues a decades-long decline and the number of people in Utica over 65 years old has also declined.

(D) Applicant needs to substantiate how a new facility will attract specialists to our region when the prerequisite for specialists is a sufficient population base to make doctor specialization economically feasible. Our population is declining.

(E) Although Applicant references Public Health Law 2825-b which indicates that the purpose of the State Grant is to “consolidate multiple licensed health care facilities into an integrated system of care” the Applicant omitted any explanation of how its project meets the grant’s objective. The explanation is needed because Applicant’s proposal to move the hospital structure away from the retained services at the old sites (particularly the removal of the hospital from the St. Luke’s Campus that will continue to hold a nursing home and rehab facility) seems to directly oppose the intent of the legislation. In addition, the removal of the hospital from the St. Luke’s Campus to Downtown will place at least 2 miles between the new facility and the existing de facto “medical district” composed of the numerous medical providers that have recently located near St. Luke’s along Burrstone and French Roads in New Hartford and in the Utica Business Park, including an outpatient surgical center. Because they are recent, these providers are unlikely to follow the hospital Downtown. Increasing the distance between the hospital and these providers seems contrary to good patient care.

Montecalvo to Planning Board 6/7/2018 Page 3

Section 1.3 Project Description

A. Although the project description mentions the acreage of private property that Applicant will need to acquire, it fails to disclose that this will involve displacement and/or loss of approximately 40 businesses/not-for-profits and the Utica Police Garage, permanent loss of taxable properties, and the permanent loss of properties that have in-place the public infrastructure and zoning needed to support small business development. Arguably these are the best properties for small businesses in the region due to their location in Utica’s Central Business District. Utica will lose current tax revenue, important social services, jobs, and opportunities to grow jobs and its tax-base in the future. Neither the Draft Scoping Document nor any of the Application documents make any attempt to estimate the sales tax currently generated within the project area that will be at risk, to estimate the cost to duplicate the police garage off-site, to estimate the

cost to duplicate off-site the public infrastructure now available for entrepreneurial growth, to estimate the non-hospital jobs currently within the project area that will be lost, or estimate the cost to duplicate lost businesses and not-for-profits elsewhere. Based upon the history of actual projects in Utica and Rome, most of the small businesses and their jobs will be lost. Although the Applicant will be liable for only a small fraction of these losses, they are real and represent a regional social and economic cost of the proposed project that will fall upon individuals, business owners, and taxpayers. State and local governments have spent literally hundreds of millions of dollars to create a relative handful of jobs locally. Will we have to spend such huge amounts again just to make up for the jobs that this project will consume? The Applicant needs to clearly state what it is asking Utica and the region to risk in exchange for Applicant locating its proposed state-of-the-art health care facility in Downtown Utica.

B. The Draft Scope erroneously claims that +/- 373 inpatient beds will be transitioned to MVHS IHC in Downtown Utica. That statement is contradicted by the NYS Department of Health's Needs Analysis, which states that 24 of those beds will remain at the St. Luke's Campus for Physical Medicine and Rehab. That means that the MVHS IHC will only transition 349 beds to Downtown Utica. The Final Scope needs to contain an accurate description.

C. The Draft Scope indicates that the proposed project will involve construction of approximately 2650 parking spaces, or greater than

7.5 spaces per hospital bed. This far exceeds the design requirements used elsewhere (e.g., Houston, TX 2.2 per bed; Palm Beach County, FL

Montecalvo to Planning Board 6/7/2018 Page 4

1 space per 2 beds; St. Paul, MN 0.5 spaces per bed). Every space impacts the environment. Unneeded spaces create unnecessary impacts. The EIS needs to

substantiate the number of parking spaces planned. D. Applicant's description of disposition and re-purposing of existing hospital campuses is unacceptably vague given the region's history of blight caused by the abandonment of hospital buildings at the Central New York Psychiatric Center. The EIS must contain assurances that Applicant's abandonment of facilities will not create new blight in South Utica and New Hartford. As mitigation, consideration should be given to requiring MVHS to post a performance bond to fund continued maintenance and/or demolition of the abandoned hospital buildings if they are not repurposed within an appropriate specified time period.

E. Given that Applicant proposes to abandon its hospital tower at St. Luke's and/or change its use, it must be determined whether Utica's decades-old agreement to provide fire protection for the building will still apply or whether that responsibility and cost will fall upon the Town of New Hartford.

Section 1.4 Potentially Significant Adverse Environmental Impacts The Draft Scope needs expand to include the following information under the following "Environmental Topics":

A. Impact on Surface Water: Utica currently has a number of combined sewers and combined sewer overflows which pass untreated sewage and/or tainted runoff directly into the Mohawk River, bypassing the Water Pollution Control Plant, during periods of wet weather. (1) The new hospital building will produce a volume of raw sewage concentrated at one location. (2) The acres of new parking will produce a volume of tainted runoff. Both will empty in an area of Utica where sewer infrastructure is old and likely to combine stormwater and wastewater. The EIS needs to identify the routes wastewater and runoff from the proposed project will take to their ultimate point of disposal in the Mohawk River, whether the sewers same will pass through are separate, combined, or both; whether they are adequate to handle the flows calculated; and whether or not any wastewater or tainted runoff will bypass the Water Pollution Control Plant and enter the River untreated. Flows from the proposed "U- District" adjacent to the hospital site should also be considered as a cumulative impact. Relocating the proposed project to the St. Luke's Campus should be considered to avoid these and new all surface water impacts (see "E" under Section 1.9 Reasonable Alternatives below).

Montecalvo to Planning Board 6/7/2018 Page 5

B. Impact on Groundwater: Relocating the proposed project to the St. Luke's Campus should be considered to avoid all new groundwater impacts (see "E" under Section 1.9 Reasonable Alternatives below).

C. Impact on Flooding: Flooding is dismissed as an issue by the Applicant based upon the project area not being within a floodway or 100/500 year floodplain as shown on federal maps. However, the lack of a floodway designation does not eliminate flooding as a substantive and significant issue. On July 1, 2017, significant flooding (causing abandonment of cars, risk to human life, and property damage) occurred on a newly reopened section of the North- South Arterial and adjacent Lincoln Avenue in an area labeled "area of minimal flood hazard" on the federal map. Per media reports State DOT officials claimed that their drains worked properly but indicated there was insufficient capacity in the stormsewers or receiving stream to prevent the flooding from occurring. This flooding occurred approximately one half-mile from and at a higher elevation than the project site. The project description in the Draft Scope indicates that some storm sewers will be removed, some existing will be used, and others will be constructed with a connection to the State DOT stormsewer line. The proposed project will create acres of new, unbroken pavement (i.e., less able to retain/slow runoff than a patchwork of old/broken pavement, sidewalks, roofs, yards, etc.). Applicant's mere claim that the proposed project will increase pervious surfaces does not resolve the question. Given the proximity of the project area to a known area of urban flooding, the potential that some of the same overwhelmed systems may be depended upon to carry away storm water from the project site, the likely increase in amount and speed of runoff from new pavement (which would increase water depth wherever flow is impeded), and the potential of risk to human life and property, the EIS must contain calculations of the amount of runoff from the project site using appropriate design criteria, and identification and assessment of the capacities of the systems/streams that will be used to convey runoff away from the project site without creating new problems downstream. Runoff from the proposed "U-District" adjacent to the

hospital site should also be considered as a cumulative impact. Relocating the proposed project to the St. Luke's Campus should be considered to avoid all potential flooding impacts (see "E" under Section 1.9 Reasonable Alternatives below).

D. Impact on Air: The proposed project will close portions of several streets including Cornelia (which connects Oriskany Boulevard with Court St.) and Lafayette (which connects Bleecker St. from East Utica with portions of West Utica), forcing drivers on these streets to detour over non-direct routes, lengthening their trips, increasing

Montecalvo to Planning Board 6/7/2018 Page 6

traffic, and resulting in corresponding increases in air-pollution. The hospital itself will be a new traffic and air pollution generator. Cumulative impacts from anticipated projects nearby also need to be addressed. These impacts on air should be assessed in the EIS. Relocating the proposed project to the St. Luke's Campus should be considered to avoid the operational impacts to air, and minimize the numbers of persons exposed to construction impacts to air (see "E" under Section 1.9 Reasonable Alternatives below).

E. Impact on Aesthetic Resources including Lighting: Relocating the proposed project to the St. Luke's Campus will minimize both construction and operational impacts (see "E" under Section 1.9 Reasonable Alternatives below).

F. Impact on Historic and Archeological Resources: Relocating the proposed project to the St. Luke's Campus will completely avoid impacts to Historic and Archeological Resources (see "E" under Section 1.9 Reasonable Alternatives below).

G. Impact to Transportation: The proposed hospital will generate new traffic for Downtown that may exceed street capacity, particularly when considered

cumulatively with other projects anticipated nearby. Traffic will be exacerbated by the project's proposed street closures described at D. above. Relocating the proposed project to the St. Luke's Campus will avoid all the operational transportation impacts and minimize most construction impacts (see "E" under Section 1.9 Reasonable Alternatives below).

H. and I. Impacts on Utilities and Impacts on Energy: Applicant fails to disclose, and the EIS needs to address, the impact of the proposed project on the Applicant's Co-Generation Facility recently constructed on the St. Luke's Campus but shared with Utica College, whether it will remain economically viable, or whether the power capacity will be wasted when the hospital tower is shut down. Cumulative impacts to Utilities and Energy from anticipated projects nearby also needs to be considered. Relocating the proposed project to the St. Luke's Campus will minimize the need to reconfigure utilities (water, sewer, electric) and the impacts from doing so (see "E" under Section 1.9 Reasonable Alternatives below).

J. Impact on Noise and Odor: Relocating the proposed project to the St. Luke's Campus can be expected to minimize construction impacts, and avoid operational impacts since the need to demolish old buildings and remove old public infrastructure and contaminated soil and debris would be minimized(see "E" under Section 1.9 Reasonable Alternatives below).

Montecalvo to Planning Board 6/7/2018 Page 7

K. Impact on Human Health: Although the Applicant makes reference to the CSX Railroad Tracks about 900 feet north of the project site, the existence of an Oneida County Comprehensive Emergency Management Plan, and expected coordination with various Emergency Response entities, Applicant fails to mention that Bakken crude oil is regularly transported over railroad tracks within a half-mile of the project site, that accidents have occurred in the past on these tracks, and that when accidents involving such cargo occur, evacuation within a

half mile of the accident site is often necessary. Although the probability of such an accident may be considered by some to be remote, the consequences can be disastrous, as demonstrated by the 7/6/2013 Lac-Mégantic, Quebec accident. These unstated facts substantiate that an issue exists. The potential consequences make the issue significant. Given the potential risk to human life, the EIS must contain an assessment of whether or not an evacuation of what will become Greater Utica's only hospital will be feasible in the event a Lac-Mégantic-style accident were to occur. If evacuation is determined to be feasible, an evacuation plan should be included as an Appendix to the EIS. Relocating the proposed project to the St. Luke's Campus, which is out of the danger zone, would avoid this particular potential impact to human health. It will also avoid introducing the new impacts already mentioned in the Draft Scope into the Downtown Utica neighborhood(see "E" under Section 1.9 Reasonable Alternatives below).

L. Consistency with Community Character and Plans: Applicant fails to disclose that the site of the proposed project lies within the Gateway Historic Canal District (an area bounded by Genesee, State and Columbia Streets and the CSX Tracks) which has its own specific master plan, that said plan recommended amendment of the zoning regulations for the district to encourage mixed-uses by establishing building-form requirements, that the Utica Planning Board unanimously recommended approval of the zoning amendment, that the Oneida County Planning Department recommended approval of the amendment, and that on 3/16/2005 the Utica Common Council unanimously approved the amendment. This neighborhood-specific plan and building-form requirements are consistent with the more general Utica Master Plan approved by the Council in 2011 which envisions mixed uses and "walkability" Downtown. Because they have been approved by the Common Council, it is understood that these plans and requirements are binding on the Planning Board and all who propose building within this district, and cannot be overridden with a mere site plan approval. Based upon Applicant's plans revealed to the public thus far, the proposed project materially conflicts with these officially approved/adopted plans and goals. Furthermore, since the existing street grid was established by city ordinances over the years, Applicant's proposal to close portions of streets for the proposed

Montecalvo to Planning Board 6/7/2018 Page 8

project also presents a "material conflict" with the community's plans and goals as officially adopted. Per 6 NYCRR 617.4(vi), these material conflicts are per se a substantive and significant adverse environmental impact that either must be mitigated by redesign of the proposed project to conform to the aforesaid requirements, or avoided by relocating the proposed project to either the St.

Luke's Campus or the Psych Center Campus (see "E" under Section 1.9 Reasonable Alternatives below). M. Impacts on Solid Waste Management: Relocating the project to the St. Luke's Campus will minimize impacts related to demolition.

N. Environmental Justice: The proposed project not only threatens the continued existence of non-hospital jobs in this environmental justice neighborhood, but also threatens several charitable services located there. Relocation of the proposed project to either the St. Luke's Campus or the Psych Center Campus would totally avoid these impacts.

Section 1.5 Cumulative Impacts The EIS needs to develop the information on cumulative impacts identified at Section 1.4 A, C, D, G, H and I above, all of which could be avoided by relocating the proposed project to either the St. Luke's Campus or the Psych Center Campus(see "E" under Section 1.9 Reasonable Alternatives below).

Section 1.6 Unavoidable Adverse Environmental Impacts Determination of unavoidable impacts must be made with reference to both the St. Luke's Campus and Psych Center Campus as reasonable alternative sites to allow a comparison regarding which site better minimizes or avoids adverse environmental impacts. Involved agencies will not have a sound basis for their SEQR findings without this information. For the reasons explained at "E" under Section 1.9 Reasonable Alternatives below, it is believed that the St. Luke's Campus best minimizes or avoids adverse environmental impacts.

Section 1.7 Irreversible and Irretrievable Commitment of Resources The EIS summary should include the existing streets and other public infrastructure that will be removed; the buildings to be demolished including the police garage; the businesses and associated jobs, income and personal wealth that will be lost; the loss of taxes (property and sales) to local jurisdictions; and the lost potential for Utica to grow jobs and tax base through conversion of developable acreage into parking lots and hospital related structures. This topic

Montecalvo to Planning Board 6/7/2018 Page 9

should also include a similar summary for the St. Luke's Campus and the Psych Center Campus alternatives to permit a comparison to be made.

Section 1.8 Growth Inducing Aspects

This section of the EIS should include (A) consideration of "negative growth" with associated impacts (the spread of blight and waste of community resources), (B) discussion of whether the intent of the State's Smart Growth Policy (Environmental Conservation Law Article 6) will be implemented, and (C) substantive evidence and reasoned elaboration to back up conclusions rather than speculation and forward looking statements. Currently available information suggests that the proposed project, when completed, will exacerbate the region's negative population trends through the destruction of jobs. Hospital jobs will be reduced due to the reduction in hospital beds from 571 to 373 (see the NYS Department of Health's Needs Analysis). Most non-hospital jobs (as yet uncounted) associated with the approximately 40 entities currently within the downtown hospital footprint will disappear based upon the 90%+ closure rate experienced by Rome, NY businesses previously in the footprint of its Ft. Stanwix urban renewal project. The proposed project's occupation of 25 Central Business District Acres, primarily for parking, not only will remove this acreage from private development but also drive up the cost of remaining CBD property by restricting supply. That will discourage new startups and the creation of new jobs.

Meanwhile the City of Utica will be burdened with providing municipal services to new facilities that do not generate taxes, raising taxes for everyone else and making Utica less attractive for investment. The excessive parking facilities will foster more dependency on the automobile. Simply put, the proposed project will replace an urban neighborhood that contributes to its upkeep with suburban sprawl that will not. The EIS needs to not only address these concerns, but also acknowledge that they could be minimized by placing the new facility on the St. Luke's Campus.

Section 1.9 Reasonable Alternatives

A. This section of the Draft Scope repeats the inaccurate, misleading statements and omissions addressed in "Section 1.2 Project Purpose" above. My comments there are incorporated here by reference. Please correct these elements in the Final Scope.

B. In its Certificate of Need Application, Applicant has interpreted the State's Grant as requiring a site within Oneida County's "largest population center" by appending the words "which is Utica" that do not appear in the law. Applicant now, inconsistently, lists the St.

Montecalvo to Planning Board 6/7/2018 Page 10

Luke's Campus (in New Hartford) and the New Hartford Shopping Center as "reasonable alternatives" to be considered. Since it would be "unreasonable" for agencies to consider alternate sites that do not qualify for the Grant, the listing of New Hartford sites as "reasonable alternatives" should be construed as both a waiver of future arguments that the legislation requires the proposed project to be within Utica, and as an admission that the identified sites in New Hartford are located "within the largest population center" of Oneida County.

C. The New Hartford Shopping Center must be rejected as a “reasonable alternative” to be considered in the EIS because: 1. It was not one of the several sites considered in Applicant’s secret siting study and presumably does not meet the Applicant’s criteria.

2. Applicant neither owns nor has a purchase option on the site (see 6 NYCRR 617.9(b)(5)(v) ('g')).

3. The proposed use is inconsistent with the Village of New Hartford’s zoning ordinance.

4. Conversion to tax-exempt status would likely create unacceptable and destabilizing financial consequences to the Village.

5. Forcing the existing businesses to move will likely result in permanent closures, unacceptable job losses, potential blight elsewhere in the Village, and sprawl.

D. The Utica Psychiatric Center is appropriately considered as a reasonable alternate site because it is located within the County’s “largest population center,” was included in Applicant’s secret siting study, and, thus, presumably meets the Applicant’s base criteria. This site needs to be weighed against the proposed Downtown and St. Luke’s sites as to environmental impacts (both those identified above and, perhaps, others) and a determination made as to which site minimizes adverse impacts to the maximum extent. In discussing this site, the EIS needs to elaborate on or note the following:

1. Applicant lacks ownership or a purchase option to the site (see 6 NYCRR 617.9(b)(5)(v) ('g')).

2. The proposed use of the site would be consistent with zoning, applicable local plans, the street grid, and prior site history (involving hundreds of patients and staff on site at any particular time). There would be no adverse change to community character. Bringing back a healthcare related use to the site could

reverse the neighborhood decline that followed abandonment of Psych Center buildings.

3. Operational impacts to the environment could be expected to

Montecalvo to Planning Board 6/7/2018 Page 11

be similar to those of the past but without an actual study and comparison of what needs to be constructed to what is now there, their significance is unclear.

4. Construction impacts to the environment and sensitive receptors off site could be buffered by both the larger site (several times the size of the Downtown site), and by less intense land uses in the surrounding neighborhood than what is Downtown. Fewer buildings to raze on this site also suggest fewer impacts than at the proposed Downtown site.

5. This site presents fewer opportunities to minimize impacts through the reuse of ancillary facilities than is possible on the St. Luke's Campus.

6. The larger campus suggests that the need for a parking garage could be replaced with surface parking.

7. Since the land is already tax-exempt institutional and existing uses would not have to be dislocated, all the adverse economic, social, business, jobs, smart growth, sprawl, environmental justice and tax consequences associated with the Downtown site would be avoided.

E. The St. Luke's Hospital Campus is appropriately considered as a reasonable alternate site because it is located not only within, but at the virtual center of the County's "largest population center" making its location convenient to the entire region that will be served by the new facility. As Applicant's acknowledged "back-

up” to the Downtown site (Applicant was not required to choose a back-up), the Applicant cannot now credibly deny that the St. Luke’s Campus will meet ALL its needs. This site needs to be weighed against the proposed Downtown and Psych Center sites as to environmental impacts and a determination made as to which site minimizes adverse impacts to the maximum extent. In discussing this site, the EIS needs to elaborate on or note the following:

1. The St. Luke’s Campus is the ONLY site under consideration for the proposed project that the Applicant actually owns or controls(see 6 NYCRR 617.9(b)(5)(v) ('g')).
2. Per the following Table (taken from the NYS Department of Health's Needs Analysis) if the new facility were to be constructed on the St. Luke’s Campus, it would result in a negligible increase of THREE BEDS.

Montecalvo to Planning Board 6/7/2018 Page 12

This suggests that the variety and intensity of operational environmental impacts of locating the new facility on the St. Luke’s Campus should be virtually identical to those associated with the facility that is there now, i.e., NO new or increased impacts to the environment should be expected at the St. Luke’s site. This includes impacts to surface water, groundwater, flooding, air, aesthetic resources, transportation, utilities, energy, noise, odor, human health, and solid waste management.

3. Locating the new hospital facility on the St. Luke’s Campus (which is more than double the size of the proposed Downtown MVHS IHC) will minimize the environmental impacts associated with construction because (a) the need to bulldoze an entire neighborhood that is likely to contain asbestos and other contaminants from prior uses is eliminated;(b) the proposed project can and should be scaled back to be essentially a replacement of the existing hospital tower, eliminating the need to duplicate existing ancillary, non-healthcare related

facilities that can be re-used, such as the recently constructed medical office building, new cafeteria, new co-generation plant, helipad, and parking lots; (c) the excessive parking proposed for Downtown can be eliminated;(d) the larger site and less intense land uses in the surrounding neighborhood with much space between nearby buildings and the site will buffer impacts to off-site receptors.

4. New areas of environmental concern would be sensitive receptors on site, and a small federal wetland on site. The sensitive receptors can be dealt with as they were in the past given that the existing hospital tower has undergone several major additions over the years of its existence without interruption in service. The emergent wetland is of minimal environmental significance, has been previously encroached upon by the Applicant for a roadway and parking lot without regulatory problem, could be easily replaced or moved to a more convenient location, or be avoided altogether given the large size of the site.

5. The St. Luke's site is far enough away from the Bakken Crude

Montecalvo to Planning Board 6/7/2018 Page 13

transport route to eliminate all possibility of having to evacuate the facility in the event of a rail accident.

6. The proposed project at the St. Luke's Campus would be fully consistent with Town of New Hartford zoning, plans, and involve no change to community character.

7. Since the St. Luke's Campus is already tax-exempt, institutional, and existing uses would not have to be dislocated, the adverse economic, social, business, jobs, smart growth, sprawl, environmental justice and tax consequences associated with moving services to the Downtown site would be avoided.

8. Placing the new hospital tower on the St. Luke's Campus (a) eliminates the need for the Applicant to establish and maintain an additional medical campus, (b) advances the Grant's purpose to "consolidate multiple licensed health care facilities into an integrated system of care," (c) will maintain the proximity of hospital treatment to the providers in the region's de facto medical district consistent with good patient care.

Section 1.10 Elements of the DEIS

A. The Draft Table of Contents for the Draft EIS will have to be revised to reflect the concerns detailed above.

B. Appendices must include the complete Site Selection Study and an Evacuation Plan.

Section 1.11 Irrelevant or Non-Significant Issues or Impacts

Impacts on Flooding must be eliminated from this list for the reasons detailed above under Section 1.4 C.

Thank you for your attention to these matters.

Very truly yours,
Frank Montecalvo

Re: Hospital Sourcing Document Response

Please find the attached my Hospital Sourcing Document Response.

I am available should you have any questions or concerns.

Mohawk Valley Health Systems
 Hospital Scoping Document Response
 Michael J. Romano, Director
 Oneida County Office for the Aging/Continuing Care
 June 7, 2018 - 5:00 p.m.
 New York State Office Building
 207 Genesee Street
 Utica, New York

Thank you for the opportunity to speak about the proposed downtown hospital project on behalf of the needs of our region's older residents and those with special needs. I am Michael Romano, Director of Oneida County's Office for the Aging and Continuing Care. I would like to commend the leaders of the Mohawk Valley Health Systems who have the vision and foresight to create a facility that intends to consolidate existing resources while eliminating duplications of services with the goal of expanding the breadth and scope of medical services.

I believe that a state-wide goal to incorporate the latest technology in equipment and availability, along with a plan to attract specialists of the upmost importance to better serve our communities' increasing older population. Those known to be at greatest risk for acquiring multiple chronic and acute illnesses require and deserve the most skilled medical care available.

Since we know our area already has a high percentage of older persons as illustrated by our County demographics which include more than 50,000 persons over the age of 65 in Oneida, which includes over 48,000 living in the cities of Utica and Rome. Demographic projections indicate this population will increase significantly by 2050. If you consider this idea from a regional perspective, the older population age 60 and older (the age group that tends to be the highest utilizers of acute and primary care) are projected to increase by nearly 60,000 by 2040, or from 124,727 to 182,550 over our five county region (Tulsa, Montgomery, Albany, Schoharie, Herkimer, and Oneida Counties).

While planning to accommodate for plans in need of emergency department care, acute care and charges and long-term rehabilitation and community care, I urge the planners to not only consider the demographic projections but to consider the national hospitalization rates of older persons. National data indicates that while hospitalization rates of those age 65 and older are significantly higher than those between the ages of 45-65, they are generally up to three times higher than those under the age of 45 (CDC 2015).

Statewide census statistics to project those age 85 and older, will increase by 15% between 2000 to 2025 (NYSEDAL). Due to this trend, it is important to approach this with increased focus on the needs of the older population when providing staffing patterns, attracting specialists, planning the overall interior environment, functionality and accessibility design throughout your new facility.

Our medical community collectively works together to create and implement interventions to improve health indicators for all, of all ages, improve transitions between all types of care and reduce or prevent emergency room visits and hospital re-admission. However, Medicare data still tells us that health events such as congestive heart failure, pneumonia, infections, stroke and fractures are the most common causes for hospital admission of the older population aged 65 and older. With that in mind, and also with the demographic projections we know so well, your plan to expand and improve this region's health care delivery is the solution needed to continue to move our community forward, increase the quality of care for all ages and to serve families now and the years ahead.

Brian Thomas
Commissioner of Labor and Economic Development
110 State St
1 Kendall Plaza
Ellettsville, NY 13320

Dear Mr. Thomas:

Please find the following comments made by myself and Mr. David Glinski - Director of Health District, at the SEQ? public hearing held at the State Office Building on Thursday June 7, 2018. Our comments were in support of the downtown MGH new hospital location.

David Glinski:

I support the downtown location for the new MGH hospital. The proposed downtown location for the new hospital has several positive aspects for an area with the left half demolished. First, old, neglected, poorly maintained buildings, some of which have old lead based paint (which is a major health hazard) and have been made as residential will be removed. Second, the removal of the piers structures in the area coupled with the new construction will facilitate water system installation, clean up, and upgrades. Third, there will be safe walkways with green space combined with the complete reconstruction will be a positive for pedestrians in the section of downtown Ellettsville.

Patricia Boyer:

With this new hospital location comes the opportunity for new and strengthened relationships with the urban community. The medical public health care hospital Community Health assessment identifies a city of Ellettsville with higher than average numbers of obesity, chronic disease, childhood lead poisoning and substance use. Therefore, the downtown location is destined out to be a opportunity for the new hospital to utilize outreach primary strategies within the city's urban community, where it will live and where it will serve.

Many factors that contribute to health are outside of the health care system. The social determinants of health has the greatest progress in addressing racial and ethnic disparities and socio-economic status of individuals health status. The NY State Promise Agenda recognizes the critical role of health care providers' health improvement, with emphasis on actions of the community and environments, to achieve Prevention Agenda objectives with a goal of improved health status of New Yorkers. Within the health care setting, strategies that increase access to care and user care meaningful engagement with the care setting will support the goal of improved health and reduction of disparities through increased chronic disease prevention. This development will provide growth and improvement of a healthcare system for a rapidly aging population. The downtown location will provide an easily accessed shelter population need. The combined services from existing locations to this single point will also increase operational efficiencies, decreasing the rate of healthcare spending.

Please contact me should you have any questions.

Sincerely,

Patricia A. Singer
County Director of Health

Mr. Thomas:

I dropped the June 19 letter to your office today, and the other document here is the one Shawn and I read at the meeting June 6.

Please share these with the board (lead agency) in the process of reviewing the downtown hospital VS the Saint Luke's or other area for the hospital.

Respectfully,
Karen Corrigan
Wilcor International

[COMMENTS OF KAREN CORRIGAN-RIDER TO CITY OF UTICA PLANNING BOARD RE: DRAFT SCOPE FOR ENVIS PROJECT W/CEIR]

- I. Good evening my name is Karen Corrigan-Rider and I'm here tonight on behalf of The Clarks, LLC, which owns the property at 233 Lafayette Street, and Wilcor International which has its annual product show and displays at 333 Lafayette.
 - A. Our property and a substantial portion of our business is in the footprint, and if the project were to be approved, we and many of our employees, several of whom live in the City of Utica, would be displaced if we're to continue our business here in the Mohawk Valley.
 - B. We're grateful that the Board is holding this hearing on ENVIS' draft scope for the Environmental Impact Statement, and we intend to submit written comments as well.
- II. The draft scope by ENVIS is a starting point, but it's a mere skeleton of what a proper scope for a project of this scale and magnitude should be.
 - A. We understand that the SEQRA process involves some give and take and from the first draft scope it's clear that ENVIS expects to take, and the community to give.
 - B. This is their first offer and we urge the Board to come back with a more reasonable and realistic scope for a EIS that will more fully achieve SEQRA's objective of elevating environmental considerations to equal footing with social and economic considerations.
 - C. Since this final scope will provide the blueprint for this entire environmental impact review, it's imperative that we get this right at the outset as we all embark on the process together.
 - D. It will be the Board's determination whether the final scope is adequate, so please give this document and this claim your most careful consideration - this is not a time to skimp.
- III. How an applicant will finance a particular project is not typically relevant to a project's purpose and need, therefore we ask that the state grant not be referenced or discussed in the section on purpose and need as those two parameters need to be independently and clearly established in this record.
 - A. Spending money for the sake of spending money is not a legitimate purpose, and need must be based on established and objective criteria.
- IV. SEQRA's broad definition of environment includes existing patterns of population concentration, distribution or growth, and existing community or neighborhood character.
 - A. This project would affect multiple communities and neighborhoods in Oneida County, not just downtown, and it would bring drastic changes to various neighborhoods and communities around the proposed and existing facilities.
 - B. We don't believe the draft scope properly addresses these existing patterns and character, and the significant impacts the project will have on our existing patterns of growth and development in our neighborhoods.
 - C. We urge the Board to take the necessary hard look and analyze how the project would affect the neighborhood and community where the project is proposed, including people and businesses such as ours who would be displaced, as well as those around the

- existing facilities, including the associated medical service businesses who have made significant investments around the existing facilities.
- D. Please don't gloss over these important subjects, please make sure that they're subject to thorough analysis and a robust discussion in the DEIS, and please make very sure that adequate mitigation is imposed for all of these impacts.
- V. Similarly, SEQRA requires that all Draft Environmental Impact Statements identify and discuss all reasonably related short term and long term impacts, cumulative impacts and other associated environmental impacts.
- A. Other associated environmental impacts from the Project include the secondary impacts that would result from the displacement of property owners and businesses within the footprint of the Project.
- B. We understand economic impacts are not directly within the purview of SEQRA, but to the extent this project would substantially interfere with and alter our existing patterns of population, concentration, distribution and growth, and significantly affect several existing neighborhoods and communities, the secondary impacts to displace property owners and businesses must be thoroughly analyzed and mitigated.
- VI. The draft scope will determine the only alternatives will be analyzed and discussed in the DEIS, and if an alternative is not in the scope it's not fair game so it's extremely important that the range of reasonable alternatives in the scope be as broad and comprehensive as the project is large in scale and scope.
- A. At the very least, the final scope should include an alternative that would involve upgrading, renovating, and/or retrofitting MCHS' existing facilities to achieve its objective of improving the delivery of patient care.
1. Such an alternative is viable and could likely achieve significant advancements and efficiencies in patient care at substantially less cost than the construction of a new facility.
- B. We implore the Board to make sure the range of alternatives specified in the scope is appropriately broad and reasonable, and that it omits unreasonable throwaway alternatives such as the New Harbor Shopping Center.
- VII. Please do your own independent and thorough review of the draft scope, rely on your own professionals and independent consultants instead of solely on those working for MCHS, and please err on the side of inclusion instead of exclusion when it comes to finalizing the scope, because if something is not in the scope, it won't be in the DEIS, and any of our labor comments on any matters not addressed in the DEIS will be completely ignored.
- A. That's why this scoping document is so important, so please get it right.
- VIII. Thank you for the opportunity to make these oral comments.

Cathy Mack

Attention: Mr. Brian Thomas, Commissioner
City of Utica, Department of Urban & Economic Development

Re: Draft Scoping Document - MVHS Proposed Downtown Hospital

Dear City of Utica Planning Board:

This letter represents Wilcox International, Inc. ("Wilcox") and The Claris, LLC ("Claris") in connection with the proposed MVHS Downtown Hospital (the "Project"). This correspondence follows oral comments previously provided to the Utica Planning Board on June 6, 2018 by Karen Corrigan-Rider and Shawn Corrigan concerning the Draft Scoping document for the Project, and to avoid unnecessary duplication, Wilcox and Claris join in the written comments of Frank Montecavallo and this correspondence incorporates Mr. Montecavallo's written comments by reference.

As previously indicated by Ms. Corrigan-Rider and Mr. Corrigan at the June 6 Scoping Meeting, the Claris property and a substantial portion of Wilcox's business is in the Project footprint, and if the project were to be approved, many of Wilcox's employees, several of whom live in the City of Utica, would be displaced if they are to continue their successful business in the Mohawk Valley.

The draft scope by MVHS is a starting point, but it is a mere skeleton of what a proper EIS scope for a project of this scale and magnitude should be. We understand that the SEQRA process involves some give and take, and from this first draft scope MVHS expects to take, and the community to give. This is of course the applicant's first draft and we urge the Board to propose a more comprehensive, reasonable and realistic Scope for a Draft Environmental Impact Statement ("DEIS") that will more fully achieve SEQRA's objective of elevating environmental considerations to equal footing with social and economic considerations. Since the final Scope will provide the blueprint for this entire environmental impact review, it is imperative that the

Planning Board reasonable and encompass a proper Scope that will be sufficiently protective of the environment. It will be the Board's determination whether the final Scope is adequate, so please give this Scoping document and this effort your most careful consideration, and please do not rely entirely on the applicant's draft Scope.

We would also like to reiterate for the record that how an applicant will finance a particular project economically is not within SEQRA's purview and is not typically relevant to a project's purpose and need, therefore we ask that the state grant not be referenced or discussed in the section on purpose and need as those two parameters need to be independently and clearly established in this record. Spending money for the sake of spending money is not a legitimate purpose, and a project's need must be based on established and objective criteria.

SEQRA's broad definition of "environment" at 6 NYCRR Section 617.2 includes existing patterns of population concentration, distribution or growth, and existing community or neighborhood character. This Project would affect multiple communities and neighborhoods in Oneida County, not just downtown, and it would bring drastic changes to various neighborhoods and communities around the proposed *and existing* facilities. We don't believe the draft Scope properly addresses these existing patterns and character, or the significant impacts the Project would have on our existing patterns of growth and development in our neighborhoods. We urge the Board to take the necessary "hard look" demanded by SEQRA and analyze how the Project would affect the neighborhood and community where the Project is proposed, including people and businesses such as Wilcox who would be displaced, as well as those around the existing facilities, including the associated medical service businesses who have made significant investments around the existing facilities. Please don't gloss over these important subjects, please make sure that they're subject to thorough analysis and a robust discussion in the DEIS, and please make very sure that adequate mitigation is imposed for all of these impacts.

Similarly, SEQRA requires that all Draft Environmental Impact Statements identify and discuss all reasonably related short-term and long-term impacts, cumulative impacts and other associated environmental impacts. Other associated environmental impacts from the Project include the secondary impacts that would result from the displacement of property owners and businesses within the footprint of the Project. While strictly economic impacts are not directly within the purview of SEQRA, to the extent this project would substantially increase with and alter the city's and the county's existing patterns of population concentration distribution and growth, and significantly affect several existing neighborhoods and communities, these secondary impacts to displaced property owners and businesses must be thoroughly analyzed and mitigated.

The draft Scope will describe the only alternatives to be analyzed and discussed in the DEIS, and if an alternative is not in the Final Scope it won't be considered at any time in the future so it's extremely important that the reasonable range of reasonable alternatives in the final Scope be as broad and comprehensive as the Project is large in scale and scope. At the very least, the final scope should include an alternative that would involve upgrading, renovating, and/or

restructuring MVHS' existing facilities to achieve its objective of improving the delivery of patient care. Such an alternative is viable and could likely achieve significant advancements and efficiencies in patient care at substantially less cost than the construction of a new facility. We implore the Planning Board to make sure the range of alternatives specified in the final Scope is appropriately broad and reasonable, and that it omits unreasonable "throwaway" alternatives such as the New Hartford Shopping Center.

We expect the Planning Board to do its own independent and thorough review of the draft Scope, to rely on your own professionals and independent consultants instead of solely on those working for MVHS, and to err on the side of inclusion instead of exclusion when it comes to finalizing the Scope, because if something is not in the Scope, it won't be in the DEIS, and any of our later comments or any matters not addressed in the DEIS will be completely ignored. That's why this Scoping process and document is so critically important.

Please make these written comments on behalf of Wilbur and Charis part of the official SEQRA record for this Project. Thank you for the opportunity to comment.

Very truly yours,

Douglas H. Zanelis

Re: Draft Scoping Document, MVHS Proposed Downtown Hospital

Dear Chairman Matrulli and Members of the City of Utica Planning Board:

This office represents Wilcor International, Inc. ("Wilcor") and The Cloris, LLC ("Cloris") in connection with the proposed MVHS Downtown Hospital (the "Project"). This correspondence follows oral comments previously provided to the Utica Planning Board on June 6, 2018 by Karen Corrigan-Rider and Sean Corrigan concerning the Draft Scoping document for the Project, and to avoid unnecessary duplication, Wilcor and Cloris join in the written comments of Frank Montecalvo and this correspondence incorporates Judge Montecalvo's written comments by reference.

As previously indicated by Ms. Corrigan-Rider and Mr. Corrigan at the June 6 Scoping Meeting, the Cloris property and a substantial portion of Wilcor's business is in the Project footprint, and if the project were to be approved, many of Wilcor's employees, several of whom live in the City of Utica, would be forced to alter their commute if Wilcor is to continue its successful business in the Mohawk Valley.

The draft scope by MVHS is a starting point, but it is a mere skeleton of what a proper EIS scope for a project of this scale and magnitude should be. We understand that the SEQRA process involves some give and take, and from this first draft scope MVHS expects to take, and the community to give. This is of course the applicant's first draft, and we urge the Board to propose a more comprehensive, reasonable and realistic Scope for a Draft Environmental Impact Statement ("DEIS") that will more fully achieve SEQRA's objective of elevating environmental considerations to equal footing with social and economic considerations. Since the final Scope

will provide the blueprint for this entire environmental impact review, it is imperative that the Planning Board assemble and compose a proper Scope that will be sufficiently protective of the environment. It will be the Board's determination whether the final Scope is adequate, so please give this Scoping document and this effort your most careful consideration, and please do not rely entirely on the applicant's draft Scope.

We would also like to reiterate for the record that how an applicant will finance a particular project economically is not within SEQRA's purview and is not typically relevant to a project's purpose and need, therefore we ask that the state grant not be referenced or discussed in the section on purpose and need as those two parameters need to be independently and clearly established in this record. Spending money for the sake of spending money is not a legitimate purpose in and of itself, and a project's need must be based on established and objective criteria.

SEQRA's broad definition of "environment" at 6 NYCRR Section 61.7.2 includes existing patterns of population concentration, distribution or growth, and existing community or neighborhood character. This Project would affect multiple communities and neighborhoods in Oneida County, not just downtown, and it would bring drastic changes to various neighborhoods and communities around the proposed and existing facilities. We don't believe the draft Scope properly addresses these existing patterns and character, or the significant impacts the Project would have on our existing patterns of growth and development in our neighborhoods. We urge the Board to take the necessary "hard look" demanded by SEQRA and analyze how the Project would affect the neighborhood and community where the Project is proposed, including people and businesses such as Wilcox who would be displaced, as well as those around the existing facilities, including the associated medical service businesses who have made significant investments around the existing facilities. Please don't gloss over these important subjects, please make sure that they're subject to thorough analysis and a robust discussion in the DEIS, and please make very sure that adequate mitigation is imposed for all of these impacts.

Similarly, SEQRA requires that all Draft Environmental Impact Statements identify and discuss all reasonably related short-term and long-term impacts, cumulative impacts and other associated environmental impacts. Other associated environmental impacts from the Project include the secondary impacts that would result from the displacement of property owners and businesses within the footprint of the Project. While strictly economic impacts are not directly within the purview of SEQRA, to the extent this project would substantially interfere with and alter the city's and the county's existing patterns of population, concentration, distribution and growth, and significantly affect several existing neighborhoods and communities, these secondary impacts to displaced property owners and businesses must be thoroughly analyzed and mitigated.

The draft Scope will determine the only alternatives to be analyzed and discussed in the DEIS, and if an alternative is not in the final Scope it won't be considered at any time in the future so it's extremely important that the reasonable range of reasonable alternatives in the final Scope be as broad and comprehensive as the Project is large in scale and scope. At the very least,

The final scope should include an alternative that would involve upgrading, renovating, and/or retrofitting MVHS' existing facilities to achieve its objective of improving the delivery of patient care. Such an alternative is viable and could likely achieve significant advancements and efficiencies in patient care at substantially less cost than the construction of a new facility. We implore the Planning Board to make sure the range of alternatives specified in the final Scope is appropriately broad and reasonable, and that it omits unreasonable "throwaway" alternatives such as the New Hartford Shopping Center.

We expect the Planning Board to do its own independent and thorough review of the draft Scope, to rely on your own professionals and independent consultants instead of solely on those working for MVHS, and to err on the side of inclusion instead of exclusion when it comes to finalizing the Scope, because if something is not in the Scope, it won't be in the DEIS, and any of our later comments on any matters not addressed in the DEIS will be completely ignored. Re: Mohawk Valley Health System ("MVHS") Integrated Health Campus, State Environmental Quality Review Act ("SEQRA") Draft Scoping Document

Dear Board:

As the region's principal economic development organization, the UUCI Board of Directors on June 27, 2017 voted to endorse the proposal by MVHS to locate its new Integrated Health Campus on a 25-acre site in downtown Utica. The EDC Board reached its resolution that the proposal will vastly improve the delivery of healthcare services for area residents while simultaneously fostering the revitalization of downtown Utica and contributing to the region's economic transformation.

To date, MVHS has completed major milestones necessary for this project, which includes:

- Securing approval of the \$300 million grant from the NYS Department of Health;
- Receiving approval of its Certificate of Need (CON) Application through the NYS Department of Health;
- Advancing design on the proposed 672,000 Square Foot modern state-of-the-art healthcare facility with the goal of commencing construction by end of Q3 2019;
- Negotiating real estate options with affected property owners including the properties owned by the Utica Urban Renewal Agency. To date, more than 40% of the properties are under contract and MVHS is in active negotiations with several of these properties;
- Executed a Memorandum of Agreement with the County of Oneida, and City of Utica for planned development of a 1,550 vehicle parking garage under a public-private partnership that will support both MVHS parking and downtown Utica parking needs; and
- Forged strategic partnerships with Masonic Medical Research Institute on incorporating medical laboratory space within the new MVHS integrated health care campus and expanding medical education opportunities in conjunction with SUNY Upstate Medical University.

All of these milestones are integral steps necessary to move forward with this historic opportunity to build a modern hospital facility that will serve the region's long-term healthcare needs and also facilitate the redevelopment of a portion of downtown Utica. The proposed downtown site is centrally located with excellent road access with the newly completed Seneca project and improvements to Onisway Blvd that are under way.

The proposed downtown site contains a number of properties that are vacant, underutilized and this section represents an area in need of economic revitalization that will complement improvements made at the Adirondack Park Center, the newly renovated Excelsior Hotel and refurbished Delta Hotels by Marriott. The construction of a new state-of-the-art healthcare campus in downtown will help stimulate

rents and in surmounting of photo buildings in Beggs Square, and downtown Jacksonville for redevelopment that need an economic district that will enable these properties to be redeveloped.

One of the key requirements necessary for this project is satisfying requirements under the State Environmental Quality Review Act (SEQRA). The purpose of this letter is to comment on the proposed Scoping Document that serves as the basis for the Draft Environmental Impact Statement (DEIS) for the Magnet Health Campus project that is being proposed by MCHS and will address specific environmental impacts identified.

Either directly, or in its capacity as providing staff support to other economic development organizations, UDCG has been involved in several ongoing major master plan developments. This includes the redevelopment of the former Unifirst on Long Beach Blvd what is now Griffiths Business and Technology Park in the City of Rome, and the planned development of the advanced electronics site, commonly referred to as Many Elements- that is being prepared on a 454-acre site at SUNY Polytechnic Institute's campus in Watervliet.

In both of these projects, a scoping document was prepared to identify and assess potential environmental impacts with the planned redevelopment of a 3,500-acre former Air Force installation that was slated for realignment as a result of the base closure process; and a 40-acre site that is a strategic statewide asset being positioned to expand New York's advanced electronics ecosystem. The final scoping documents for those strategic sites then formed the preparation of a DEIS and was publicly available for review and comment to the public, interested parties and involved agencies before findings could be made on the proposed project.

The proposed scoping document developed for the MCHS project is comprehensive and provides for a thorough and rigorous review of potential environmental impacts that will be addressed in the DEIS. Many of the potential impacts identified have been vetted through the extensive outreach the MCHS has conducted on this project, including questions on alternative site options that were considered for the new hospital.

We believe that the proposed scoping document will provide a basis for evaluating all key environmental impacts for this priority project and will address many of the questions raised related to this regional project in the proposed downtown location. We look forward to reviewing the final draft DEIS as it is prepared.

Sincerely,

Steven D'Alto

Commissioner Thomas,
I have attached my comments in regard to the environmental impact scoping. I briefly paraphrased these comments at the public hearing.
Dennis S. Davis
Commissioner
Department of Public Works
Oneida County

My name is Dennis Davis, I am the commissioner of the Department of Public Works for the County of Oneida. My comments will be brief in regards to environmental impacts and I am in support of this project. I have been involved in many heavy construction projects in the 38 + years that I have worked in this department.

Construction projects of this scope can have many environmental concerns especially in regards to storm water management. They also provide an opportunity to make dramatic improvements to current conditions resulting in long-term benefits that otherwise would be difficult to attain.

Separation of storm water and sanitary discharge will be a continued focus for this community for years to come. Storm water management has many new technics and devices that will be available for consideration in the design for this project and should provide for potential improvements.

Subject: Comments to add to Public Scoping for proposed downtown hospital

Attn: Mr Colon --- Mr Priore --- Mr Caruso --- Mr Mitchell --- Mr Matrulli --- Mr Thomas

Please place the following into Public Comments --- SEQRA --My name is Donna Beckett -- I spoke at the Public Session held at NYS Office Bldg on Thurs June 7, 2018. I want to be sure you read the following -- in addition to my recorded comments that evening. 1) the Paid Employee Department Heads of Oneida Co were there and did not provide any documentations to their points, it was all opinion of their job positions that they hold. They are employed by Anthony Picente. 2) John Swann is the paid employee spokesperson for Newmvhospital--downtown ---and again required to promote a downtown site by his employer - the Community Foundation. The man from Genesis (paid or not) same....and again both only speaking 'support' and no verification of why. Regardless of being private citizens, their personal & employment agenda should not be much considered.....you all know the audience, after a few DH took turns speaking, gave a quiet chuckle or sigh.....they knew why those 'appeared'. 2) Bob Heins -architect -spoke against the DT site and he speaks with a great deal of experience, review of this plan, and involvement with the politicians and hospital. As a matter of fact (you can contact verify and call him for his first person account) he was, in the early days of this proposal, for DT site, on the yes side.....he's now opposed.....he no longer is for it. He is the architect who worked with Bank of Utica and their recent tower. He stated he was one of the original members, many years ago, on the NYS committee to design the SEQRA regulation/requirement document and process....pay close attention to his verbal speaking points made that night. 3) I expect (and remembering Mr Colon's surprised?alarmed? facial expression) when you will do the 'work load of researching', as stated by Mr Keblish, this huge responsibility task it requires AND NOT RELY AT ALL on political operatives or 'others' who talk the good spin.....I have looked at both sides - and heard all taxpayers, residents, local urban planners, hosp and local architects, medical staff of drs, nurses, support staff AND let's not forget Red Zone, it is a real danger regardless of 'evacuation procedures'...(BTW --I'm the person who brought the question up 'do you know --to Robert Scholefield at West Utica Neighborhood Meeting April 2017 as a result of speaking to a local volunteer firefighter who is employed by one of those affected business in Columbia/Lafayette) and Scholefield had just found out, a month before, of that concern from ----of all people (not Utica/County/planners/hosp engineers/architects at 18mos into plans) but the young adult child (a hospital employee) of that firefighter who told me during my (remember?) survey time in the NEIGHBORHOOD.....there is a less costly (money, livelihood, history, street grid, taxes taxes taxes) ALTERNATE site -- St Luke's Campus with incinerator (oh, DT hospital will truck red bag waste thru streets to incinerator at St. Lukes---hope they don't bump into ambulance carrying Nursing Home resident from St Lukes Home to/from DT hospital- - Nursing Home

must remain at St Lukes Check with New York State Dept of Health and CON and Dormitory Auth the Gov
Office as to private taxpaying residents have written complaining of proposed DT
site.

Re: Draft Scoping Document, NYHS Proposed Downtown Hospital

Dear Members of the Utica Planning Board:

The following items must be considered and addressed as part of the SEDRA process in the Draft Scoping Document for the NYHS Proposed Downtown Hospital:

Section 1.4 -- Potentially Significant Adverse Environmental Impacts:

- **Ability to complete the project.** The speculative nature of the costs estimates for this project are woefully inadequate given the rapidly rising prices of materials (such as steel and aluminum) and the ultimate cost to us.
- **The new, City of Utica-initiated Historic District.** There are at least two significant buildings (301 and 401 Columbia Street) that are proposed to be demolished that are located within the new Utica Historic District that has been approved by the NY State Historic Preservation Office (NYSHPO).
- **Numerous buildings that are eligible for inclusion on the State and National Registers of Historic Places that will be lost if the project proceeds as planned.** There are at least four significant properties that are eligible for inclusion on the State/National Registers of Historic Places that would be demolished if this project proceeds as planned.
- **Complete and total disregard for the City of Utica Master Plan.** The adopted Utica Master Plan calls for low-rise, mixed use development that incorporates existing structures.
- **Complete and total disregard for the City of Utica Erie Canal Gateway District.** The adopted Utica Gateway District Plan calls for low-rise, mixed use development that incorporates existing structures.

- **The need to release the Site Selection Study:** To underscore the non-transparent and flawed nature of this entire process, the often referred-to Site Selection Study has not been released for public scrutiny.
- **The proposed hospital will be located within the 1/8 mile evacuation zone of the CSX railroad mainline:** The US Department of Transportation maintains a critical evacuation zone one-half mile on either side of mainline railroad tracks where trains transporting Bakken oil and/or other hazardous chemicals routinely travel. The proposed hospital footprint is squarely within this potential evacuation zone.

The impact on the neighborhood, including, but not limited to, the existing, tax-paying businesses, will be devastating.

The impact on the taxpayers of both the City of Ulica and of Oniska County, will be devastating.

The nature of healthcare in general is changing rapidly and dramatically, what is considered "state of the art" by today's standard will likely be obsolete by the time that this facility is finally constructed. Furthermore, the perpetuation of many now, stand-alone outpatient clinics in the area tend to preclude the need for a more traditional-style hospital.

No plan has been put forward as to the ultimate fate of the remaining campuses (St. Luke's, Faxon, and St. Elizabeth's).

In conclusion, the proposal to place a new hospital in downtown Ulica has far more environmental impacts than benefits when considering the alternative of the existing St. Luke's campus.

Thank you for your attention to this matter.

Utica, NY, 13502

Attention: Mr. Brian Thomas, Commissioner

City of Utica, Department of Urban & Economic Development

Ref: Draft Scoping Document, MVHS Proposed Downtown Hospital

Dear City of Utica Planning Board:

This letter is in response to the Utica Planning Board's request for public comment.

I see the entire decision for downtown was made before any consideration of environmental impact called for public input in the legislation. I'd like to enter all 710 pages of emails into today's records (incorporation by reference) that clearly show that public input was not sought. The downtown site was a predetermined decision by Anthony Brindisi, Anthony Picenti, Larry Gilroy and Steve DiMeo pushed on MVHS.

In 2015 downtown references such as "guide siting(citing) decision in favor of downtown", "push for downtown", "downtown site preferable", "preference of downtown site", "downtown site has political support", "case for a downtown site", "hope they are seriously considering downtown as their primary location" all before called for public input circumvented the proper process. The "legislation called for" public meetings also failed to include advertised public meetings in Madison and Herkimer counties.

Thank You

Joseph Cerini

Utica Planning Board – SCOPING Process - June 20, 2018

bthomas@cityofutica.com

City of Utica Planning Board
1 Kennedy Plaza
Utica, NY, 13502
Attention: Mr. Brian Thomas, Commissioner
City of Utica, Department of Urban & Economic Development

Ref: Draft Scoping Document, MVHS Proposed Downtown Hospital

Dear City of Utica Planning Board:

This letter is in response to the Utica Planning Board's request for public comment.

I see the entire decision for downtown was made before any consideration of environmental impact called for public input in the legislation. I'd like to enter all 710 pages of emails into today's records (incorporation by reference) that clearly show that public input was not sought. The downtown site was a predetermined decision by Anthony Brindisi, Anthony Picenti, Larry Gilroy and Steve DiMeo pushed on MVHS.

In 2015 downtown references such as "guide siting(citing) decision in favor of downtown", "push for downtown", "downtown site preferable", "preference of downtown site", "downtown site has political support", "case for a downtown site", "hope they are seriously considering downtown as their primary location" all before called for public input circumvented the proper process. The "legislation called for" public meetings also failed to include advertised public meetings in Madison and Herkimer counties.

Thank You

Joseph Cerini

ONEIDA COUNTY
OFFICE OF THE COUNTY EXECUTIVE

ANTHONY J. PICENTE JR.
County Executive
631.546.6222

I am Oneida County Executive Anthony J. Picente Jr. and these are my written comments related to the June 7, 2018 public scoping hearing pursuant to the New York State Environmental Quality Review Act with respect to the Integrated Health Campus Project proposed by Mohawk Valley Health System. The submission of these comments was required by June 20, 2018.

A new integrated health campus in downtown Utica is a key component to the future of this region. It means state-of-the-art healthcare for the next generation of patients, as well as a state-of-the-art facility to assist in the recruitment of the next generation of doctors. This project has already shown the ways in which our medical community will be improved by this project.

MVHS will be strengthened financially and medically by combining its two outdated 100-year-old facilities and enabling it to provide better healthcare to our community and the region going forward. This project has also resulted in a unique partnership between MVHS and the Masonic Research Lab which will position this new facility as a leader in medical research. Many more opportunities will also be made possible through this crucial endeavor.

I strongly support this project because, first and foremost, it is essential to the future of the health of this community. I also, however, support this project because of the location. Long has the proposed area been blighted, abandoned and in disrepair. Not in my lifetime has that area seen a half a billion dollars in development. In fact, no area in this entire city, county or region has ever seen that type of investment into a single project in a single area.

In one fell swoop a neighborhood ignored for over 50 years will become the focal point of the new Utica. With a new hospital campus comes 3,500 plus employees over three shifts. With a new campus comes new streets, landscapes, walking paths, light and connectivity to the adjacent areas. Upon completion, one of the bleakest areas of Utica will become a brand new beacon of light and energy.

There are currently businesses and non-profits within the proposed district, but the largest land owner is the City of Utica because so many of the buildings are abandoned. In many cases they have been so for decades. I have no reason to believe that the handful of active businesses and non-profits located there cannot stay in either the City of Utica or the County of Oneida. They are an important part of this community and we should help to keep them here.

The scoping document is an essential piece to the SEQRA review and I'm pleased to see it is professional, thorough and addresses the SEQRA cookbook from beginning to end. This scoping document is about the location of this facility. Through this process, questions about the impact on transportation, flooding, emergency management, historic resources, noise, human health and many others will be addressed fully. County government stands ready to assist with our expertise in any way possible.

This is a once-in-a lifetime opportunity to rebuild this city, and while there are always challenges to a project of this importance and magnitude, together as a community we can overcome them.

Thank you for your time.

Anthony J. Picente Jr.

Re: The City of Utica Planning Board's *State Environmental Quality Review* Scoping Session
Comment Letter for Mohawk Valley Health System's *Construction of the Integrated Health
Campus*, City of Utica, Oneida County, New York

Dear Mr. Thomas:

DASNY ("Dormitory Authority State of New York") is in receipt of the City of Utica Planning Board's ("UPB's") Positive Declaration and Notice of Intent to prepare a *Draft Environmental Impact Statement ("DEIS")* as well as the *Draft Scoping Document*. DASNY thanks the UPB, as lead agency, for holding the Scoping Session related to the proposed Mohawk Valley Health System's ("MVHS") *Construction of the Integrated Health Campus ("IHC")*. DASNY encourages public input whenever possible in the State Environmental Quality Review ("SEQR") process and exercise the Scoping Session option for all our projects requiring an *Environmental Impact Statements ("EIS")*. DASNY, in conjunction with the New York State Department of Health's ("NYSDOH's") Statewide Health Care Facility Transformation Program ("SHCFTP"), would be funding the construction of the proposed IHC.

DASNY's review of the *Draft Scoping Document* comprehensive listing of *Potentially Significant Adverse Environmental Impacts* illustrates the magnitude of the project. Analysis of the various environmental topics reveal some areas where focused efforts would be beneficial to the project and community. DASNY would stress the need for complete Environmental Site Assessments on all properties included within the project limits of the proposed IHC. The historic uses within this former industrial section of the city may have included substances now known to be health hazards, potentially leaving behind toxic residue.

Mr. Brian Thomas, A.I.C.P.
June 19, 2018
Page 2

While the *Potentially Significant Adverse Environmental Impacts* table notes the need for a “*Traffic Impact Study with study limits coordinated with NYSDOT and the City of Utica*”, the demapping and closure of a portion of Lafayette Street from Broadway west to State Street, additional study may be required as it relates to the existing below-streetbed infrastructure, and how existing municipal systems remain functional during construction. Additionally, any existing easements in place for private utilities would need to be examined.

The Proposed Project description notes that Faxton St. Luke’s Healthcare (“FSLH”) and the St. Elizabeth Medical Center (“SEMC”) would be consolidated and relocated to form the proposed MVHC IHC. DASNY would note that the proposed environmental review should include an analysis of the future reuse(s) of the FSLH and SEMC campuses, to the extent that they are known, once consolidation of these facilities is accomplished. Additionally, clarification of all currently existing hospital-related functions to remain operational at the FSLH and SEMC facilities after consolidation should be described.

DASNY would also recommend that a complete description of the existing services at the FSHL and SEMC campuses and related environmental impacts should be discussed in the *DEIS*’ Project Overview and Existing Conditions section. This would provide a more fulsome description of the current and anticipated environmental impacts in order to establish the appropriate baseline for measuring the potential environmental impacts of the Proposed Project. Additionally, any foreseeable future expansions, such as the potential future medical office building, should be addressed in the *DEIS*. If the potential environmental impacts cannot be addressed at this time, please provide the reasoning and if future environmental reviews will be undertaken as the future projects evolve.

DASNY would also like to encourage UPB to undertake a robust analysis of Environmental Justice within the study area of the IHC development site. The analysis should document any potential positive or negative socioeconomic impact due to changes in area income levels or other demographic characteristics.

The Proposed Project should also be vetted for compatibility with any existing City of Utica or Oneida County comprehensive plans. These documents may help conceptualize the development of the IHC and further the revitalization of this area of the City of Utica.

Mr. Brian Thomas, A.I.C.P.
June 19, 2018
Page 3

Lastly, the Revised *Environmental Assessment Form – Parts 1, 2, and 3* (“EAF – Parts 1, 2, and 3”), dated April 4, 2018, lists DASNY as a “Potential Property Condemnation/Eminent Domain” agency. DASNY does not have a role as a condemner for the taking of property related to the Proposed Project. DASNY’s role remains as a joint administrator, along with New York State Department of Health (“NYSDOH”), for the financing of the Proposed Project through grant funding, and that of a potential private bond issuer on behalf of MVHS.

Thank you again for the ability to comment as an involved agency funding the Proposed Project. All additional project related correspondence or documentation should continue to be submitted to me at: **Mr. Robert S. Derico, R.A., Senior Environmental Manager, Office of Environmental Affairs, Dormitory Authority State of New York, 515 Broadway, Albany, New York 12207-2964** or via electronic mail at ***rderico@dasny.org***.

Respectfully,

A handwritten signature in blue ink, appearing to read "R. Derico", is written over a light blue grid background.

Brian, Fred, Planning Board,

Please see the attached. I have included a list of potential negative impacts that need review and/or further scoping in the pages within this document. Please let this serve as a cover letter for the SEQRA scoping input.

I also am urging the planning board to ensure that this project is treated as a private development project, that has received a government grant for partial funding, and that the project be reviewed in its entirety.

Thank you, and please see the following pages and file it public scoping response for the MVHS SEQRA.

Regards,

Michael Galime

COUNCIL PRESIDENT, CITY OF UTICA

Potential Adverse Impacts, MVHS Hospital Proposal – input for EIS.

New Hartford & South/West Utica Vicinity

Power Plant Cogeneration Facility

What will be the impact of MVHS leaving the cogeneration power plant facility behind? Will the operator continue to run the plant, and how will this effect the power delivery and rates for Utica College?

How will this effect the overall grid for the area?

Medical Office and Outpatient Facility Locations

Many outpatient facilities and medical offices have located and/or been built within the St. Luke's facility. This includes the Omni Surgical Center, as well as many offices within the business park. Will these locations need to relocate, and if so, will this cause unplanned financial burden on the overall medical community?

Cost of Facility Reuse

The St. Luke's Campus is said to be marketable to private development, however, within the Oneida County Local Development Corporation (OCLDC) application, as of February 2018, the entire campus is not being decommissioned. Who will maintain the property to insure it is not depreciating and left to become decrepit post abandonment, or when partially abandoned.

South Utica Genesee St Vicinity

Facility Reuse

Is there a known plan to market and maintain the property at St. Elizabeth's? Allowing this facility to wain while vacant may impact the overall status of upper Genesee St. Who will maintain the property to insure it is not depreciating and left to become decrepit post abandonment, or when partially abandoned?

Medical Office and Outpatient Facility Locations

Many outpatient facilities and medical offices have located within the St. Elizabeth's area. How much of the surrounding area would be left vacant if there is a general push to move all ancillary medical business downtown?

Downtown Utica Vicinity

Unrealized Potential Cost

The current budget for the hospital proposal does not include water, sewer, gas delivery, or overall infrastructure cost. Who will be expected to pay for these additions to the project if there are overruns or unanticipated issues crop up.

Facility Placement Impact

A blanket statement has been made that there is a need to place medical care within reach of people in socio-economically stressed scenarios. The current proposal and scoping document proposes the construction of an acute care facility with surgical and emergency services. Placing a facility of this type

in the urban core of the greater Utica area may create a situation that the care that is most needed by the population discussed as “in need” in the MVHS proposal and state legislation will not be able to receive the clinical and chronic care at the proposed facility.

It is very possible and should be studied that spending 1 billion dollars rearranging the region around a single facility of this design is not addressing the actual needs of this community.

This consideration should be studied regardless of the chosen location.

Traffic and Congestion

The City of Utica is becoming more congested as the municipal center grows. There is more potential for access issues in an urban center. In 2017 Route 12 was closed due to accidents and weather events multiple times, causing Genesee St and Route 5 to become gridlocked. The potential impact of locating our proposed single emergency care facility in this situation must be considered.

Heliport

The heliport specified in the filings is not a helipad. Can a helicopter land within this proximity to buildings, on a ground level, safely? How will people be transported into the facility, considering its placement adjacent to the proposed facility.

Impact of Increased Power Grid Use

The new facility is no longer going to produce its own power. There may be an impact to overall rates and delivery. Has this been studied, and it should be included into the overall potential environmental impact.

Financial Impact to City of Utica

The financial impact to the City of Utica is not understood at this point. There are unknown and unspecified costs regarding infrastructure, facility relocations, parking garage costs, and the introduction of a large tax abatement. A long term (5 year, 10 year, and 15 year) outlook should be analyzed and considered. Above and beyond property tax, there will be a loss in property tax, and increase in services that should be studied and considered adverse due to the impact to the City.

All accountable costs, revenue loss, revenue gains, and expenses must be considered.

Financial Impact to City of Utica School District

If the downtown location is chosen, the Utica School District will be losing tax revenue funding.

Financial Impact to County

If the downtown location is chosen, the Oneida County will be losing tax revenue funding.

Financial Impact to City of Utica Library

If the downtown location is chosen, the Utica Library will be losing tax revenue funding.

Impact of loss of Central Business District

The direct cost to the City of Utica in aiding MVHS to build a downtown facility may be greater than the cost to reinvigorate the current tax paying business district through use of the same street scape and façade improvements proven to work on Genesee St and repairing and reutilizing our current parking structures for Hotel and Auditorium needs.

The indirect cost of spending money to reduce the ability to generate tax revenue will spread the direct costs of the MVHS aid from the City and County across the remaining tax paying entities left in the City of Utica, while resulting in a permanent tax abated installation.

Future Expansion: Landlocking

The current proposal calls for a reduced size single location consolidation of our medical delivery system. This is being placed in the center of the City of Utica, landlocking the facility for all future development, while surrounded by privately owned property. This will limit future expansion and should be considered and adverse effect.

Affected Property Owners and Businesses

At this time there have been adverse negative effects imposed on the central business district. MVEdge has stated multiple times that the district could have kept moving forward during the #MVHSDowntown campaign, however, in the case of the new Enterprise Car location, the city, property owners, and Enterprise were all sent correspondence from MVEdge to not develop their property because it will be taken.

This correspondence was prior to the filing of the project with the OCLDC.

Moving forward how will the affected businesses be dealt with. There has not been to date clear discussion based on this. The central business district is home to many tax paying businesses as well as not-for-profit community support businesses. The current filings from the OCLDC are stating that PILOT agreements and possible relocation costs will be dependent on job creation.

The potential negative impact is that these businesses themselves are placed in a position of stagnancy and financial impact that they would have otherwise not had to deal with if this proposal was not floated for multiple years prior to its filing.

Infrastructure Cost

The following are not currently specified within the 480million dollars of proposed cost.

- Storm Water Mitigation
- Water Delivery
- Natural Gas Delivery
- Power Delivery

There is a potential negative impact where these costs will fall outside the specified scope, and MVHS will look to the City, County, and State for additional funding.

Regional Land Use and Availability

Empty hospital site issue

The greater Utica area will be left with three empty hospital sites. The state psychiatric facility, St. Elizabeth's, and St. Lukes. Is this scoped proposal the best use of the downtown developable commercial active property, while leaving behind facilities that are currently in use empty, and have no scoped reuse and/or rehabilitation plan.

In exchange for a few empty buildings that have commercial potential downtown we are creating multiple large empty facilities with no current commercial prospects, throughout the region.

Land Availability

Downtown Utica property is becoming a premium. Reducing the available land will increase cost and sellable value, creating a situation where current business and property owners may either not be able to expand in place, or be priced out of their current options. This should be considered part of the scoping of adverse effects.

MVHS Ability to Complete

Financial Plan

At this point the scoping document and proposed project filed with the Oneida County Local Development Corporation does not demonstrate the financial ability to complete the proposed project. There is a potential situation where MVHS may not be able to fund the project fully and may turn to tax payer funding to bail out overruns.

Cost Overrun Planning

The current statement from MVHS CEO Scott Perra, when asked how the project will be dealt with if over budget, was that the project will not go over budget. This is not an adequate answer for a project of any scale.

Overall Facility Impact

The proposed purpose of the facility filed with the OCLDC and scoped within the SEQRA filings is to improve the overall delivery of health care needs in the greater Utica area.

This proposal is consolidating current facilities into one, keeping operational care the same in most areas, and reducing it in others (pediatrics), for example.

Regardless of the chosen location, there is potential negative impact that the proposed facility will not achieve proposed and pitched improvements and not increase our healthcare delivery overall, while at the same time reducing the size of the overall capabilities within the area.

Utica, NY 13502
Attention: Mr. Brian Thomas, Commissioner
City of Utica, Department of Urban & Economic Development

Ref: Draft Scoping Document, MVHS Proposed Downtown Hospital

To the honorable members of the City of Utica Planning Board:

Please find the attached response to the Utica Planning Board's request for public comment on the above-referenced Draft Scoping document. While the scale and complexity of the project will likely require that the scoping document employ some simplifying principles in its final development, I encourage the planning board to resist abridging the work required to achieve a comprehensive Environmental Impact Statement.

Regards,

Steve Keblish

IMPACT ON LAND

The following items of concern address how people use or relate to the land affected by the proposed project.

1. Land used by the City of Utica:

The City of Utica currently possesses and employs several parcels and streets within the impacted site. These publicly held lands serve interests in the public good, including supporting public safety operations, private and public transportation, commerce, parking, and preserving the historical character of Utica.

The Scoping Document should call for a review of these uses, including plans to mitigate the impacts to:

- the City of Utica's Police Maintenance Facility operations,
- plans to replace to the Police Maintenance Facility,
- the impact on closing streets to transportation and parking (especially on local events including the Boilermaker, Adirondack Bank Center events, and other events which rely on these streets),
- the historical significance of Lafayette Street,
- the historical significance of the street grid (especially as it relates to historical events associated with National Beer Day and a potential Beer Museum planned in Utica),
- the values of properties held by the City of Utica and the ability of the City to recoup the value of those properties (especially as measured against the purpose of acquiring those properties I.E.: collecting or generating property taxes).

Land used by private property owners:

The proposed site includes many private property owners who utilize the land for private commerce, non-profit activities, worship, storage, display, services, and community organizing. These lands generate benefits to the community and public in the form of property taxes, sales taxes, public space, amenities, fellowship, donations, and access to affordable food and other goods.

The Scoping Document should call for a review of these uses, including how the project will impact:

- the scarcity of urban land in the Mohawk Valley
- property tax collection, including total impact to County, City, School, and Library taxes before and after the project including the impacts on property taxes at alternate sites,
- sales tax collected within Utica and within the entire county before and after the project, including the impacts on sales taxes at alternate sites,

- the degree to which charitable giving will be available in and near the impacted site before and after the project
- the degree to which food, services, and other low-cost goods will be available before and after the project
- the degree to which space will be available for community organizing, worship, and other social activities
- the degree to which the project will displace businesses, people, or other community activities.

ATTRACTIVENESS

The follow address the impact of the proposed project on community plans, character, and aesthetics.

While beauty, design, and aesthetics can rely on subjectivity at times, Alain de Botton has put forward six points for “How to Make a City Attractive” (<https://www.citylab.com/solutions/2015/02/what-makes-a-city-beautiful/386291/>). These points are as good as any to evaluate the projects impact on the economic, human, and social environment.

The Scoping Document should call for a review of the project’s impact on these dimensions when considering the proposal and alternate locations:

1. Order (buildings should be uniform in appearance and layout—to a degree)

- To what degree does the project conform to and uphold form-based code, zoning, scenic and historic guidelines, etc.?
- To what degree to does the proposal protect or promote urban complexity? (I.E.: Avoid being “boring.”)

2. Visible life (it's nice to see people walking the streets and working in shop windows)

- To what extent does the project protect or promote street activity?
- To what extent does the project incorporate street-level permeability to the building, display hospital activities, or otherwise put the life of the hospital on show?

3. Compactness (don't sprawl)

- To what extent does design tightly pack in the hospital into the existing city fabric?
- To what extent does the hospital minimize overall land use?

- To what extent does the project promote people living close by as opposed to commuting in from a suburb?

4. Orientation and mystery (a balance of large and small streets should allow for efficient travel... and for getting lost, on occasion)

- To what extent does the project protect, or create a variety of street sizes?
- To what extent does the project protect east/west boulevards such as Columbia and Lafayette Street and smaller streets such as Carton Ave (formerly Rome St.)
- To what extent does the project prioritize streets for cars rather than people?

5. Scale (a building should be five stories max, unless what it stands for is *really* worth more air space)

- To what extent does the scale of the project conform with the scale of nearby buildings?
- To what extent does the amount of horizontal space utilized conform to urban vitality?

6. A sense of the local (Melbourne should look a little different from Barcelona, because its cultural and geographic qualities are different)

- To what extent is the design “Utica” in design?
- How does the look of the building fit with other iconic structures in Utica?
- To what extent does the project honor the canalway history of the proposed location?

While it is important to weigh the impacts on Utica directly, the scoping document should also evaluate the impacts to the Mohawk Valley overall. The city of Utica is the largest city in the Mohawk Valley. Utica’s downtown is essentially the entire region’s downtown. To any extent the project may harm the city’s urban vibrancy—as the largest and most important urban center in multi-county vicinity—it also hurts the overall region’s economic health.

Subject: SEQR Environmental Impa concerns

To whom it may concern:

Please address the following environmental impact concerns regarding the proposed downtown hospital:

Please provide proof that concerns in this SEQR process will be addressed and how.

Prove ability to complete project:

- Requires updated analysis of all costs (the cost of steel alone is skyrocketing)
- Not just cost analysis statements, but statements with backed up data (fact checked) and available to public. We want to see numbers and details.
- Also proof of data of ability to afford and pay for project to be completed in estimated time.

Prove what medical resources will be available at the new

hospital that Utica and surrounding area does not currently have access to:

- define “state of the art” in every sense that it will be used.
- will the new hospital offer services like pediatrics and a NICU (up to level 4), or will the community still have to drive up to an hour away for these regularly needed services. Why or why not?

Prove ability for growth:

- can the hospital be added on to in the proposed downtown area? Why or why not? If the answer is the building will not be needed to add on to down the road, please prove analysis and studies explaining.

Prove need for 3,000 parking spots as stated by Steve DiMeo:

- why is eminent domain being pursued over a stretch of 25 acres in downtown Utica when 2-5 acres at most will be used for the hospital and the remaining for parking?
- prove the need of each parking spot through study and analysis.

Please prove this project is not overreaching our land and is only utilizing what it needs to fulfill the completion of their proposed new hospital.

Provide site study showing why downtown Utica was the chosen site over the other options:

- show cost analysis and studies proving this is the best option for our city’s environment and surrounding area.

Please note when my husband and I moved back to Utica to open a coffee shop in downtown - the appeal was NOT because of a private hospital. We, like many of our peers, chose a city like Utica because of its history and organic small business growth and entrepreneur mindset. The region marked for the downtown hospital is the next prime real estate for retail and new businesses

to further develop Utica and be the next enticing city that future generations are looking to move to.

The way businesses have been treated in the hospital footprint (and how those of us have been treated who are outside of the footprint) has sent a strong message of what this city really values to the community and specifically my generation that includes young families and entrepreneurs.

We are seeking an apology for how people have been treated and the lack of condemnation of poor communication and low standards tolerated on BOTH sides of the argument - specifically ownership of poor treatment from “yes” downtown people as well towards those who are not comfortable with the downtown location.

Moving forward we are seeking open communication, and an honored and transparent process - legally and morally it is a concern for Utica and so far neither have been evident.

MVHS, Newmvhospital, and our city leadership is responsible for the controversy and lack of transparency revolving our downtown and the future of our healthcare. If this is not corrected moving forward it will result in an exodus of businesses and young people, just as it has already been proven by the leaving of our areas doctors and nurses.

The vacant buildings and remnants of cultural that once was would be a disgrace to our city’s morale and economy.

MVHS and anyone supporting them have a social responsibility as much as an economic one to uphold and fulfill the values and needs of Utica.

Thank you for your time,

Katrina Martin

Brian,

As requested, the New York State Department of Transportation (NYSDOT) has reviewed the request for the City of Utica Planning Board to serve as Lead Agency for purposes of the State Environmental Quality Review Act (SEQRA) in relation to the Integrated Health Campus Project proposed by the Mohawk Valley Health System. Upon review of the information provided, the NYSDOT concurs with this request.

It is our understanding that environmental evaluations are currently ongoing. In particular, NYSDOT will be interested in reviewing traffic impacts to the highway network. Please note that a NYSDOT Highway Work Permit will be required for any work performed within the highway or right-of-way.

NYSDOT also reviewed the Draft Scoping Document and have a comment concerning the proposed Street Closures, the segment of LaFayette Street between the North-South Arterial and State Street. This closure to vehicular traffic would impede connectivity and mobility without providing a benefit to pedestrians or cyclists.

We look forward to working with you as the project progresses. Thank you for the opportunity to comment.

Re: Proposed MVHS Downtown Hospital/Draft Scoping Document

Dear Gentleman:

This message is in response to the Utica Planning Board's first request for public comment on the above referenced "Draft Scoping" document.

Please kindly place the following message into the "Public Comments" section and or the appendix of subsequent, as well as the Final Environmental Impact Statement (FEIS).

↑- - - s n i p - - -

BetterUticaDowntown (BUD) was formed by the owners of Wilcor International, the Corrigan's who have a multi-generational business located in the targeted downtown hospital concept area.

Their business district was recently home to over 40+ businesses, which includes new Utica Police department and City Court upgrades. Myself, as a new property owner in the Columbia Lafayette Neighborhood (CLN) at 442 Lafayette Street, a city taxpayer with other properties in nearby Bagg's Square, and my personal involvement in many issues facing downtown Utica, caused me to immediately join BUD.

After our first meeting, and later with other members' help, we've created and added content to the website at www.BetterUticaDowntown.com.

On behalf of BUD and myself, we wish all parties and organizations involved in the MVHS Downtown Hospital SEQOR process to be made aware our website.

The downtown MVHS hospital concept goes against the character and numerous plans and efforts by private property owners who have been working towards a much different vision. The threat of eminent domain has caused some companies to move and or close down. Progress has stagnated, others are stuck, but only ~40% of property owners have signed agreements to sell to MVHS. Myself and others have no intention of selling.

As lead agency for SEQOR, before you go any further in your deliberations, you must provide ALL studies used by MVHS and others in deciding the downtown location was the preferable site over any and all other locations consider. The studies must be made public so that myself, BUD, citizens of Oneida County, and the City of Utica can see the logic as to why the downtown location was selected."

Re: Proposed MVHS Downtown Hospital/Draft Scoping Document

Dear Gentleman:

This letter is in response to the Utica Planning Board's first request for public comment for the above referenced "Draft Scoping" document. While I know the Planning Department does not have to, I kindly request that your board to add the letter in its entirety into a Section or the Appendix of subsequent, and your department's Final Environmental Impact Statement (FEIS).

First, let me say I'm entirely grateful you have declared this project a "Type I" action- I'm in complete agreement! As proposed the hospital concept would have a VERY significant adverse and UNREVERSIBLE impact on Utica's downtown.

So everyone is aware, I co-founded #NoHospitalDowntown shortly after hearing doctors (three hospital board members), were being told, "The new hospital has to go downtown". This was learned in the late summer of 2015. Since this time I have had a large part in curating two website (www.NoHospitalDowntown.com and www.BetterUticaDowntown.com), as well as posting many thousands of message to these group's Facebook pages and other social media platforms.

Why am I so dedicate to this group and its mission?

My first motivation was to counteract lies that were being told, and information that was not accurately shared with our community. As the hospital future in the Columbia Lafayette Neighborhood came into clear focus; the impact to it's

businesses, the history, the buildings, streets, and alleys - knowing about Utica's past urban renewal projects - I became much more concerned.

After meeting and talked with our political leaders, attending meetings where incomplete and or bad information was continually supplied or withheld, concern escalated. My thinking was that a great deal of ignorance was being displayed. For years this has gone on as taxpayer treasure and virtually "millions of dollars" from our region's healthcare spending was being used to promote the downtown hospital concept. My opposition only increased.

We have witnessed politicians and numerous community groups (of which they control, or hold sway over) to work together to try and force a hospital into Downtown Utica. Early on they told me, "Give it a chance, let the hospital develop their concept", "We will make it fit into the neighborhood", and meetings with Landmarks gave some hope. Yet these and other comments have turned out to be a falsehoods or just to "buy more time". We are now faced with the complete destruction of 34 or 25 acres of our downtown's Central Business District.

The hospital concept has VERY few who want, and actually, if everyone in the debate had ALL the information, and ALL the costs, AND allowed a COMPLETE vetting of our \$300M opportunity, NOBODY would vote for a "new downtown hospital" - especially if they could foresee the fallout it would bring.

My passion regrettably is to go to court if need be, for years to come if necessary, and to go broke if need be. All to defeat lies that have been perpetrated on what I see as a MASSIVE healthcare farce, and complete downtown development plan farce.

I've addressed you each by name above (and will later copy others below), as you all must realize, **"by going forth with the downtown hospital location you will own this project until your last breath."**

How did I get to this place? Well it has EVERYTHING to do with why I've just written the serious words in the previous sentence. Here it goes, it is all about the "E" in SEQRA, see figure 1.

en·vi·ron·ment

/ɪn vɪrənment/ 

noun

The “E” in
SEQRA...

1. the surroundings or conditions in which a person, animal, or plant lives or operates.
synonyms: [habitat](#), [territory](#), [domain](#); [More](#)
2. the natural world, as a whole or in a particular geographical area, especially as affected by human activity.
synonyms: the natural world, [nature](#), the earth, the planet, the ecosystem, the biosphere, Mother Nature;

Figure 1.

In 1986 I arrived in Utica to attend SUNY. At the time the college was called the “College of Technology” and I had transferred from SUNY Morrisville where I studied Mechanical Engineering Technology.

My first Utica home was the Hotel Utica, located at 102 Lafayette Street. This historic hotel is located immediately east of the proposed hospital concept. Attending college in Downtown Utica placed me in-and-out of many historic buildings, namely two very significant mill buildings; “Mill Square” and “Globe Mill”.

Landing a summer job placed me in another such buildings when I worked for a budding entrepreneur, Frankl Giotto. That in turn

placed me in what is now the Bagg's Square Café building on Broad Street which housed a machine shop, Firschings.

My schooling, work, and other activities put me into many of Utica's old buildings. There, many stories of buildings' pasts, the city's history, companies and people were shared with me.

Later in the future, as a chamber board member I cheered with Governor George Pataki as the hotel reopened after redeveloped. One of the owners and redevelopers was Joseph Curruci, who I called a friend. All these events - stories and buildings - set the course of my life, a life that placed the City of Utica at the top.

After college, and starting a business that eventually met with success, I've purchased a number of properties in and around Utica. I was subsequently married in Hotel Utica, to my wife Michelle who came from NJ - another "transplant" - who also became enamored with the city.

One building we own today is just a few blocks from the proposed hospital concept in Bagg's Square, at 10-12 Liberty Street. More recently, I've purchased the historic town house at 442 Lafayette Street. It lies within the targeted hospital footprint from where I'm drafting part of this response. This historic property gives me greater standing to fight a legal battle, one that I feel is critically important to saving Downtown Utica's Columbia Lafayette Neighborhood.

Since my arrival in Utica I've witnessed many aspects of many different lives, perhaps many more than anyone might every expect; as a college student, landing various jobs, being dirt poor as an inventor hoping to one day strike it rich, owning a South Utica home and living through a winter without heat, experiencing many business ups-and-downs, talking to other start-ups, making 24 trips to establish an office in China, going from "being hungry to dinning as a member at the Fort Schuyler Club", to working on a 20,000 sq. feet downtown home; one with a 1st floor art gallery, home offices, a guest apartment, and an upper floors creative space for future inventors! All during this time I've kept an eye on the business community and political headlines, via the newspapers, as a board member of the Mohawk Valley Chamber of Commerce, various "young professional groups, a Genesis Group "board" member, Leadership Mohawk Valley, as well as other organizations.

Over the last 15 to 20 years, Downtown Utica has seen many efforts to spur development. They include; studies, workshops and Master Plans, symposiums, in addition to new City Legislation and Code Specifications aimed at protecting and define historic buildings and neighborhoods. Numerous people before myself - those who've inspired me - now myself, and others have purchased buildings and created businesses.

We've had such great opportunities because many downtown buildings have "great bones", offered great "long-term upside", and were relatively "very cheap to acquire". Even as some failed, others gave it "a new go". This natural progression and the struggles are actually the events that create; a community, stories, people, their struggles, the buildings and the lore, it all takes many years and define a neighborhood and the people who become attach to it.

Over the last 5 to 10 years Downtown Utica has had a newer wave of developers and businesses. People had and are making huge investments of sweat equity. Some large developers use their cash and or the government's funding to pay \$30 to \$120 per hour, yet many of us smaller folks started by working hundreds and thousands of hours for FREE, that's "sweat equity". We all have inspired each other. Some were alive and offered a helping hand, while others have been dead for 100 years, but their stories inspired us. Maybe it was the buildings and streets they built, and even though we'd never know them, that's where the encouragement came.

These are things are hard to quantify, but it and more create an "Environment", one that today is successfully drawing paying customers into downtown, only more recently have these been residents. Finally, in just the last three to five years this momentum has moved closer and closer to a tipping point. Yet from almost nowhere... we had news of a hospital?

The downtown hospital concept was a surprise to many. It was to me. I was focused, growing my business, making trips to China, one day Jim Brock called, "they want to bulldoze downtown for a hospital." Ironically, on two points; I departed the chamber board - where I met Jim Brock (#NoHospitalDowntown Cofounder) when the chamber gave up on the building they owned; I requested they embrace and seek redevelopment, but didn't. Today this building has become the Landmarc Building that holds-up Ocean Blue. The more I learned about the hospital the less I liked and Jim and I have grown the movement to over 4,100 people.

The downtown hospital concept truly "flips the script" on what many early adopters saw ahead for downtown. This massive concept never was anticipated in the city's Master Plans, wasn't in the historic plans and marketing efforts. Now we have had three years of dark clouds, a huge question mark of a very out-of-scale "suburban hospital". One with a sea of parking, one that cuts-out and destroys more of what makes downtown the opportunity myself and others have been working towards. If they bulldoze the many buildings, dream will be lost, and future developers will not have the opportunities of just described.

Our group is clear proof that many do not want a hospital in downtown. The reason vary, but it is very safe to say, "the will of the people is being ignored." Our group's research and study confirms the hospital concept is more about hopeful "economic development activity" than "improved regional healthcare".

Those saying "yes" to the downtown concept have been influenced by undue political forces and others that have minor to substantial conflicts of interest. We know that many others would voice a "no" position if not silenced due to political or employer pressures. Those on boards of "yes" groups all live in suburbs and have little appreciation and or understanding of what downtown living and building reuse is about.

Is there room in a EIS Draft Scope for my emotionally charged words above? If you suggest the answer is "No", then I'll suggest that individually, and as a project group, you must think hard about what makes a city a city, a downtown a downtown, and a neighborhood a neighborhood.

Have you read Jane Jacobs? Did you see Little Pink House? Have you read Michael Bosak, from the Great Utica Landmarks Society? Or read recent urban renewal reviews by Brian Howard, Oneida County History Center, Executive Director, who recently wrote:

"What happened in Downtown Utica during urban renewal was similar to what was happening across the country. While it wasn't appreciated at the time, urban renewal was destroying essential elements of the city's character and creating an identity crisis that would last for generations."

If the Environmental Impact Statement you are tasked with creating fails to mention these topics, then VERY important issues to downtown development and neighborhood development will be unheard. If in fact you feel my request and story is absurd, would you believe that the actions thus far on the hospital

project has given me great reason to care much less about the City of Utica? It is true, as others have echoed my sentiment.

Thus I'll implore you that you must understand, creating a huge hospital district and erasing a neighborhood - because political motivations merged with what someone believes is a great economic development plan - is very detrimental to Utica's future that this EIS/SEQRA lack the means to gage.

My wish is to make your department aware of my story, as well as all others considering this project. I've left the more technical aspects to other concerned citizens from which I know you have heard.

Without adding my feelings conveyed here to the Final Scope (which the EIS will provide involved agencies) I believe your work would be inaccurate, misleading, and offer an incomplete picture of the proposed project's impact.

Finally, your department and others who will review the SEQRA process, must know that myself and possibly others will challenge this "downtown concept" in subsequent legal actions. This was pronounced over two years ago, and those in charge have moved forward regardless.

Sincerely,

Brett Truett

Brian,

Please see attachment and acknowledge that you received this transmission.

Respectfully,

Frank Vescera

In 2012 **Experts** at the United States Department of Transportation (DOT) created an EMERGENCY RESPONSE GUIDEBOOK for "First-Responders" during the initial phase of a Dangerous Goods / Hazardous Materials transportation incident. They designated a 1/2 mile corridor on any train track route used to transport flammable oil & toxic materials as an **Evacuation RED ZONE**.

On January 28, 2014, NYS Governor Andrew Cuomo issued Executive Order No. 125: Directing DEC, DOT, DHSES, DOH, and NYSERDA to Strengthen the State's Oversight of Shipments of Petroleum Products for rail line safety.

Nevertheless , those warnings did not halt the demands of a ring of overbearing local elected & public officials to build a new Utica hospital downtown within that known train toxic spill **Evacuation RED ZONE**.

Building a Utica hospital downtown inside an evacuation toxic **RED ZONE** is like knowingly building a Nuclear Power Plant on a **dormant volcano site** or an **earthquake fault line**.

However, the back-room relentless strong-arm tactics that have been used from the beginning were recently revealed when that ring of elected and public officials were caught exchanging deceptive, threatening and insulting emails intended to manipulate and crush the public into submission.

The email exchanges raised questions of what many believed to be the widespread use of deception, official misconduct, abuse of power and betrayal of the public trust in order to rig the **Evacuation RED ZONE** downtown outcome.

Concerned citizens, MVHS hospital officials and others are continually threatened that if the hospital is not built in the downtown **Evacuation RED ZONE** it will not be built anywhere, especially at St. Luke's.

This was evidenced in one of the following email exchanges.

(11-5-15) "I feel like walking away from this whole thing and telling the community and hospital if you don't want this thing downtown then good luck at St Luke's and don't come see me for one ounce of state support"

That being said the Utica Planning Board in its SCOPING Process must provide the public with:

1. Valid & precise assurances that building the hospital in the downtown **Evacuation RED ZONE** is a moral endeavor.
2. Detailed & explicit plans for the evacuation of the hundreds of bed-ridden patients and people on operating tables that would be trapped during a toxic spill catastrophe?

There aren't 400 ambulances available to transport them. If there were 400 ambulances where would the patients be taken?

Re: Draft Scoping Document, MVHS Proposed Downtown Hospital

Dear Chairman Matrulli and Members of the City of Utica Planning Board:

This office represents Wilcor International, Inc. ("Wilcor") and The Cloris, LLC ("Cloris") in connection with the proposed MVHS Downtown Hospital (the "Project"). This correspondence follows oral comments previously provided to the Utica Planning Board on June 6, 2018 by Karen Corrigan-Rider and Sean Corrigan concerning the Draft Scoping document for the Project, and to avoid unnecessary duplication, Wilcor and Cloris join in the written comments of Frank Montecalvo and this correspondence incorporates Judge Montecalvo's written comments by reference.

As previously indicated by Ms. Corrigan-Rider and Mr. Corrigan at the June 6 Scoping Meeting, the Cloris property and a substantial portion of Wilcor's business is in the Project footprint, and if the project were to be approved, many of Wilcor's employees, several of whom live in the City of Utica, would be forced to alter their commute if Wilcor is to continue its successful business in the Mohawk Valley.

The draft scope by MVHS is a starting point, but it is a mere skeleton of what a proper EIS scope for a project of this scale and magnitude should be. We understand that the SEQRA process involves some give and take, and from this first draft scope MVHS expects to take, and the community to give. This is of course the applicant's first draft, and we urge the Board to propose a more comprehensive, reasonable and realistic Scope for a Draft Environmental Impact Statement ("DEIS") that will more fully achieve SEQRA's objective of elevating environmental considerations to equal footing with social and economic considerations. Since the final Scope

will provide the blueprint for this entire environmental impact review, it is imperative that the Planning Board assemble and compose a proper Scope that will be sufficiently protective of the environment. It will be the Board's determination whether the final Scope is adequate, so please give this Scoping document and this effort your most careful consideration, and please do not rely entirely on the applicant's draft Scope.

We would also like to reiterate for the record that how an applicant will finance a particular project economically is not within SEQRA's purview and is not typically relevant to a project's purpose and need, therefore we ask that the state grant not be referenced or discussed in the section on purpose and need as those two parameters need to be independently and clearly established in this record. Spending money for the sake of spending money is not a legitimate purpose in and of itself, and a project's need must be based on established and objective criteria.

SEQRA's broad definition of "environment" at 6 NYCRR Section 617.2 includes existing patterns of population concentration, distribution or growth, and existing community or neighborhood character. This Project would affect multiple communities and neighborhoods in Oneida County, not just downtown, and it would bring drastic changes to various neighborhoods and communities around the proposed and existing facilities. We don't believe the draft Scope properly addresses these existing patterns and character, or the significant impacts the Project would have on our existing patterns of growth and development in our neighborhoods. We urge the Board to take the necessary "hard look" demanded by SEQRA and analyze how the Project would affect the neighborhood and community where the Project is proposed, including people and businesses such as Wilcox who would be displaced, as well as those around the existing facilities, including the associated medical service businesses who have made significant investments around the existing facilities. Please don't gloss over these important subjects, please make sure that they're subject to thorough analysis and a robust discussion in the DEIS, and please make very sure that adequate mitigation is imposed for all of these impacts.

Similarly, SEQRA requires that all Draft Environmental Impact Statements identify and discuss all reasonably related short-term and long-term impacts, cumulative impacts and other associated environmental impacts. Other associated environmental impacts from the Project include the secondary impacts that would result from the displacement of property owners and businesses within the footprint of the Project. While strictly economic impacts are not directly within the purview of SEQRA, to the extent this project would substantially interfere with and alter the city's and the county's existing patterns of population, concentration, distribution and growth, and significantly affect several existing neighborhoods and communities, these secondary impacts to displaced property owners and businesses must be thoroughly analyzed and mitigated.

The draft Scope will determine the only alternatives to be analyzed and discussed in the DEIS, and if an alternative is not in the final Scope it won't be considered at any time in the future so it's extremely important that the reasonable range of reasonable alternatives in the final Scope be as broad and comprehensive as the Project is large in scale and scope. At the very least,

The final scope should include an alternative that would involve upgrading, renovating, and/or retrofitting MVHS' existing facilities to achieve its objective of improving the delivery of patient care. Such an alternative is viable and could likely achieve significant advancements and efficiencies in patient care at substantially less cost than the construction of a new facility. We implore the Planning Board to make sure the range of alternatives specified in the final Scope is appropriately broad and reasonable, and that it omits unreasonable "throwaway" alternatives such as the New Hartford Shopping Center.

We expect the Planning Board to do its own independent and thorough review of the draft Scope, to rely on your own professionals and independent consultants instead of solely on those working for MVHS, and to err on the side of inclusion instead of exclusion when it comes to finalizing the Scope, because if something is not in the Scope, it won't be in the DEIS, and any of our later comments on any matters not addressed in the DEIS will be completely ignored. That's why this Scoping process and document is so critically important.

Please make these written comments on behalf of Wilbur and Claris part of the official SEQRA record for this Project. Thank you for the opportunity to comment.

Very truly yours,

Douglas H. Zambella

Re: Proposed MVHS Downtown Hospital/Draft Scoping Document

As lead agency for SEQR, before you go any further in your deliberations, you must provide ALL studies used by MVHS and others in deciding the downtown location was the preferable site over any and all other locations consider. The studies must be made public so that the citizens of Oneida County, and the City of Utica can see the logic as to why the downtown location was selected.

Also, please take this information into consideration as well:

Red Zone Issue

long freight trains coming through Utica carry hazardous, flammable, and combustible materials far more dangerous than most people realize and by knowing these facts we have yet another major reason not to locate our ONLY new hospital in this zone of danger called the Red Zone.

Up to 30 of these types of trains now run through Utica every week.

Many have 100 cars stretching a mile down the tracks. This is a 4,000 % increase in this type of travel though this area in the past Six years.

A high-risk “Red Zone” has been declared along both sides of the railroad track to prepare emergency response for spills, fire, toxic fumes, and even explosions from a track failure or train derailment or just plain accident that occurred here just recently.

The US Dept. of Transportation puts out an emergency response guide annually. Please review this document.

Another MVHS SEQRA scoping comment

Received after the stated deadline, I might add, but thought that you would want to see it anyway.

I got the voicemail that you left earlier, Steve. I will be out on vacation starting next Friday, June 29th and won't be back in the office until Tuesday, July 10th.

- Regarding hospital downtown:
- 1) Displacement of business owners and other livelihood. Some just bank and to get site cleaned. Now you want to disrupt.
 - 2) Use you access 3,000 people in St Elizabeth + Faxon and to access other parts. St Elizabeth is because close to area.
 - 3) Proposed site near RR tracks if toxic fumes; not good choice. You have a work or displacement fumes in air for miles - you can't evacuate? Where to go with all the patients? You say you will have closed system but the employees on duty take all you have - no one can get in to relieve. Families worried... etc, etc, etc...
 - 4) All in one bucket if closed to flow of something else.
 - 5) Larger facility - no good for older people to get around it. Given no choice - if only

own hospital, it's a monopoly.
There's nothing to be done.

if your Committee already
made of their mind, you
only are. We're going out
to try and get down
that the British don't
want a. zero called for
opinion. You're giving
you do as you want
because A. Courne wants
hospital down to use of
you don't get tax money.
A. Courne wants all cities
to be right - NYC is who
are not lower class. When
we are upper by state,
we use to have a downtown
to shop in and browse.
The Christmas shopping with
the smells of Christmas was
lost over the years.

I know this is a waste
of my time and talk on
the off hand.

Sincerely,
Conrad Collette
Chief of Staff Office.

To Whom It May Concern:

Re: Proposed MVHS Downtown Hospital/Draft Scoping Document

This message is in response to the Utica Planning Board's first request for public comment on the above referenced "Draft Scoping" document. Please kindly place the following message into the "Public Comments" section and or the appendix of subsequent, as well as the Final Environmental Impact Statement (FEIS). Many historic places were obliterated, marginalized or denigrated with past projects.

Examples:

1950s: Urban Renewal - Iconic Richard Upjohn building and more destroyed

1960s: Reconstruction of Route 5S - Old Fort Schuyler Park obliterated

1970s: Bagg's Square Bridge Constructed - Birthplace of Utica (park) marginalized, Maria Proctor legacy denigrated

Many other nationally significant locations obliterated:

American Express headquarters (directly north of Bagg's Hotel on the Square

locations for experiments and founding of telegraph and Associated Press (Dudley -Triangle- Building

The hospital downtown footprint will do likewise.

Examples:

Home of Theodore Faxton, the incubator discussion meetings to devise the telegraph company and the Associated Press happened here.

The route of General Lafayette's visit to Utica in 1824 will be destroyed.

Homestead of John Butterfield where General Dan Butterfield, Civil War General and composer of TAPS lived.

One must be candid and state the obvious.

Few of these places have been fully recognized or celebrated in the past.

This has been due to the vast local-history ignorance of politicians and local government leaders and/or an unwillingness to address this issue.

For present leaders to continue in this ignorant void of our community's legacy (and proud history) is an error of magnitude proportions.

Ignorance is understandable. Not everyone is interested in history.

However, when folks, who are responsible for making decisions that affect our glorious historic legacy, are unwilling to listen, that is stupidity.

The above is just a brief plea for considering the local-history of this greater Utica community in your planning for a state-of-the-art health facility.

I am willing to meet with your board of the whole, or with any member or group of members, at your convenience to further explain the position of salvaging the little history left that has not been uselessly and cruelly destroyed.

Brian Thomas, Commissioner
City of Utica Planning Board
1 Kennedy Plaza
Utica, New York 13502

Dear Commissioner Thomas,

We offer the following in response to the draft scope document received May 25, 2018.

- The NYSDEC contact info may be changed to:
NYSDEC – Division of Environmental Permits
Utica State Office Building Room 1404
207 Genesee Street
Utica, New York 13350
- When required, the following permits are managed through the Bureau of Water Permits General Permits Section, located in the Central Office, 825 Broadway, Albany NY 12203-3505.
 - * SPDES Phase II Multi Sector General Permit (MSGP) for Stormwater
 - * Construction Activity (Permit Number GP-0-10-001)

For this reason, you may choose to add that office as a contact as well.

- DEC is not listed as a potential agency under "Water and Wastewater System Improvements Approval of Plans" in Table 1, Potential Permits and Approvals. Please note that DEC approval of new or modified municipal sanitary sewers serving the proposed project may be required under 6 NYCRR Part 750 2.10(a). If a sanitary sewer lateral serving the proposed project is designed to convey 2,500 gallons per day or more, then DEC approval of the connection may be required under 6 NYCRR Part 750-1.2(b)(2) and 6 NYCRR Part 750 2.10(h)(3)(i). Therefore, it is recommended that DEC be included as an agency in Table 1, Potential Permits and Approvals under Water and Wastewater System Improvements Approval of Plans.

6 NYCRR Part 360 regulations have recently been updated which may have impacts regarding the management and disposal of materials during both the demolition and construction phases. As plans progress, please contact Sarah Harrison, Division of Materials Management, (315) 793-2558 to insure compliance with the revised regulations.

RE: Final Scoping Document for Mohawk Valley Health System’s Integrated Health Campus project

Dear Mr. Ammon:

Per the State Environmental Quality Review Act (SEQRA) regulations, attached is a copy of the final Scoping Document for the abovementioned project in the City of Utica, New York. The City Planning Board met on Thursday, July 19th and reviewed the attached document. Based on that review, the Planning Board unanimously approved a resolution accepting the document as the final Scoping Document.

You will note that the attachment does not include all of the comments submitted or a copy of the transcript from the scoping meeting that was conducted by the Planning Board on June 7th. However, all comments submitted in writing to the Planning Board and the transcript itself was part of the document reviewed and approved by the Planning Board. Due to the size of the document, those materials have not been included in this mailing. A copy of the complete document has been posted to the City’s website - <http://www.cityofutica.com/departments/urban-and-economic-development/planning/mvhs-seqra/index>.

Should you have any questions regarding this document, please do not hesitate to contact me.

RE: Final Scoping Document for Mohawk Valley Health System’s Integrated Health Campus project

Dear Mr. Ammon:

Per the State Environmental Quality Review Act (SEQRA) regulations, attached is a copy of the final Scoping Document for the abovementioned project in the City of Utica, New York. The City Planning Board met on Thursday, July 19th and reviewed the attached document. Based on that review, the Planning Board unanimously approved a resolution accepting the document as the final Scoping Document.

You will note that the attachment does not include all of the comments submitted or a copy of the transcript from the scoping meeting that was conducted by the Planning Board on June 7th. However, all comments submitted in writing to the Planning Board and the transcript itself was part of the document reviewed and approved by the Planning Board. Due to the size of the document, those materials have not been included in this mailing. A copy of the complete document has been posted to the City’s website - <http://www.cityofutica.com/departments/urban-and-economic-development/planning/mvhs-seqra/index>.

RE: Final Scoping Document for Mohawk Valley Health System's Integrated Health Campus project

Dear Mr. Ammon:

Per the State Environmental Quality Review Act (SEQRA) regulations, attached is a copy of the final Scoping Document for the abovementioned project in the City of Utica, New York. The City Planning Board met on Thursday, July 19th and reviewed the attached document. Based on that review, the Planning Board unanimously approved a resolution accepting the document as the final Scoping Document.

You will note that the attachment does not include all of the comments submitted or a copy of the transcript from the scoping meeting that was conducted by the Planning Board on June 7th. However, all comments submitted in writing to the Planning Board and the transcript itself was part of the document reviewed and approved by the Planning Board. Due to the size of the document, those materials have not been included in this mailing. A copy of the complete document has been posted to the City's website - <http://www.cityofutica.com/departments/urban-and-economic-development/planning/mvhs-seqra/index>.

Should you have any questions regarding this document, please do not hesitate to contact me.

RE: Final Scoping Document for Mohawk Valley Health System's Integrated Health Campus project

Dear Mr. Ammon:

Per the State Environmental Quality Review Act (SEQRA) regulations, attached is a copy of the final Scoping Document for the abovementioned project in the City of Utica, New York. The City Planning Board met on Thursday, July 19th and reviewed the attached document. Based on that review, the Planning Board unanimously approved a resolution accepting the document as the final Scoping Document.

You will note that the attachment does not include all of the comments submitted or a copy of the transcript from the scoping meeting that was conducted by the Planning Board on June 7th. However, all comments submitted in writing to the Planning Board and the transcript itself was part of the document reviewed and approved by the Planning Board. Due to the size of the document, those materials have not been included in this mailing. A copy of the complete document has been posted to the City's website - <http://www.cityofutica.com/departments/urban-and-economic-development/planning/mvhs-seqra/index>.

Should you have any questions regarding this document, please do not hesitate to contact me.

RE: Final Scoping Document for Mohawk Valley Health System's Integrated Health Campus project

Dear Mr. Ammon:

Per the State Environmental Quality Review Act (SEQRA) regulations, attached is a copy of the final Scoping Document for the abovementioned project in the City of Utica, New York. The City Planning Board met on Thursday, July 19th and reviewed the attached document. Based on that review, the Planning Board unanimously approved a resolution accepting the document as the final Scoping Document.

You will note that the attachment does not include all of the comments submitted or a copy of the transcript from the scoping meeting that was conducted by the Planning Board on June 7th. However, all comments submitted in writing to the Planning Board and the transcript itself was part of the document reviewed and approved by the Planning Board. Due to the size of the document, those materials have not been included in this mailing. A copy of the complete document has been posted to the City's website - <http://www.cityofutica.com/departments/urban-and-economic-development/planning/mvhs-seqra/index>.

Should you have any questions regarding this document, please do not hesitate to contact me.

Sincerely,

Brian Thomas, AICP

I. Introduction

A. NYS Legislation

The 2015-2016 NYS Budget included legislation for the consolidation of health care services in Oneida County, New York. This allocation is intended to build one, combined, hospital providing acute inpatient, outpatient, and other health care services. The hospitals to be combined into a single facility include St. Luke's, Faxton, and St. Elizabeth's Medical Center.

The legislation language states the following:

"For payments and grants to support health care facility transformation within the county of Oneida, for capital, non-operational works. Funding will be awarded in the discretion of the commissioner of health in support of projects located in the largest population center in Oneida County, without a competitive bid or request for proposal process, for the purpose of consolidating multiple licensed health care facilities into an integrated system of acute inpatient, outpatient primary and other health care services. The Dormitory Authority may issue bonds for such purposes in an amount appropriated herein. No expenditures may be from this appropriation to a facility until a facility specific plan has been submitted to the Department of Health and has been approved by the Director of the Budget (12UT15HE)." *Total budget allocation: \$300,000,000*

B. Initial Steps

To assist the hospital in evaluating appropriate locations for the new facility, Mohawk Valley EDGE ("EDGE") engaged the services of Elan Planning, Design, & Landscape Architecture and O'Brien & Gere. The two firms worked with hospital staff and EDGE staff to undertake a process that began by looking broadly at Oneida County, identified 12 sites for further consideration, and culminated in a focused, detailed evaluation of the top 3 sites.

C. Scope of Work

The siting analysis was completed in 2 steps. The purpose of the first step was to complete an initial evaluation of each of the 12 sites to arrive at a 'go/no go' decision. This was determined based on a high level analysis of key items that are necessary for the hospital to function properly including the availability of infrastructure, adequate access, and a good transportation network. The second step immediately followed with a more detailed evaluation of the top 3 sites including evaluating the capacity to fit the hospital operations and associated parking requirements.

At the onset of the project, the design team utilized 2 previously completed reports prepared by the Hammes Company for MVHS to identify the preliminary program of hospital operations. The following information was utilized for the specific siting capacity analysis:

- 440 beds proposed (actual reduction of approx. 164 beds for 3 hospitals)
- 884,256 SF (current space in 3 hospitals is about 1.3 M SF).
- 40,000 SF Medical Office Building (MOB) to be programmed as part of development
- Estimated Cost: \$507.7 M or \$527.40/SF

- Urban Site Requirements:
 - 433,250 SF (includes parking)
 - Total acreage = 10.94
- Suburban Site Requirements:
 - 1,927,500 SF
 - Total acreage = 48.67

II. Summary of the Evaluation Process

Following is an executive summary of the evaluation process and capacity analysis. A more detailed description follows.

A. Initial data review and meeting with MVHS and EDGE Staff

At the beginning of the process, the design team met with the CEO and COO of MVHS and staff from EDGE to obtain an understanding of the key parameters of the hospital operations. Upon confirmation of the broad project program that identified the key elements of the combined facility, the design team began the evaluation process.

B. County-wide Site Search

In an effort to identify large parcels in Oneida County, a Geographic Information System (GIS) analysis was used to identify parcels 50 acres and larger that could potentially host a new combined facility. 5 and 10 mile radii were drawn around the city of Utica and a number of properties were identified for initial evaluation.

C. Level 1 Analysis

Using the results of the GIS analysis, the following sites were screened in a 'funnel' process to determine if there were 'fatal flaws' that warranted sites be eliminated from further consideration. Fatal flaws included such items as lack of infrastructure (sewer/water), access limitations, an in-adequate transportation network, initial permitting needs, and other factors that could impact the development potential of the site.

1. Yahnundasis Golf Club, Seneca Turnpike, New Hartford, NY
2. Twin Ponds Golf Country Club, Main Street, New York Mills, NY
3. New Hartford Business Park, New Hartford, NY
4. Property adjacent to SUNY Polytechnic Institute, fronting onto Route 12 South, Deerfield, NY
5. Sadaquada Golf Club, Whitesboro, NY
6. Hidden Valley Golf Club, Castle Road, Whitesboro, NY
7. Domenico's Golf Course, Church Road, Whitesboro, NY
8. Downtown - generally bounded by Oriskany Blvd on the south, Broadway on the east, State St on the west, and City Hall on the north
9. St. Luke's Hospital Campus, New Hartford, NY
10. NYS Psych Center grounds Utica, NY
11. Tect Utica, Whitesboro, NY
12. Faxton Hospital-Murnane Field, Utica, NY

D. Level 2 Analysis

With the fatal flaws analysis completed, a site selection matrix was created to complete a detailed screening of the top sites including:

1. Downtown - generally bounded by Oriskany Blvd on the south, Broadway on the east, State St on the west, and City Hall on the north
2. St. Luke's Hospital Campus
3. NYS Psych Center

E. Capacity Analysis

In addition to a detailed evaluation using the site selection criteria matrix, the team prepared a capacity analysis for the top 3 sites. This included identifying areas for hospital operations, hospital expansion area, parking facilities (surface and structured), medical office building, and patient towers. An initial capacity concept plan was prepared for all 3 sites and two sites were advanced further to consider circulation and functional entrances.

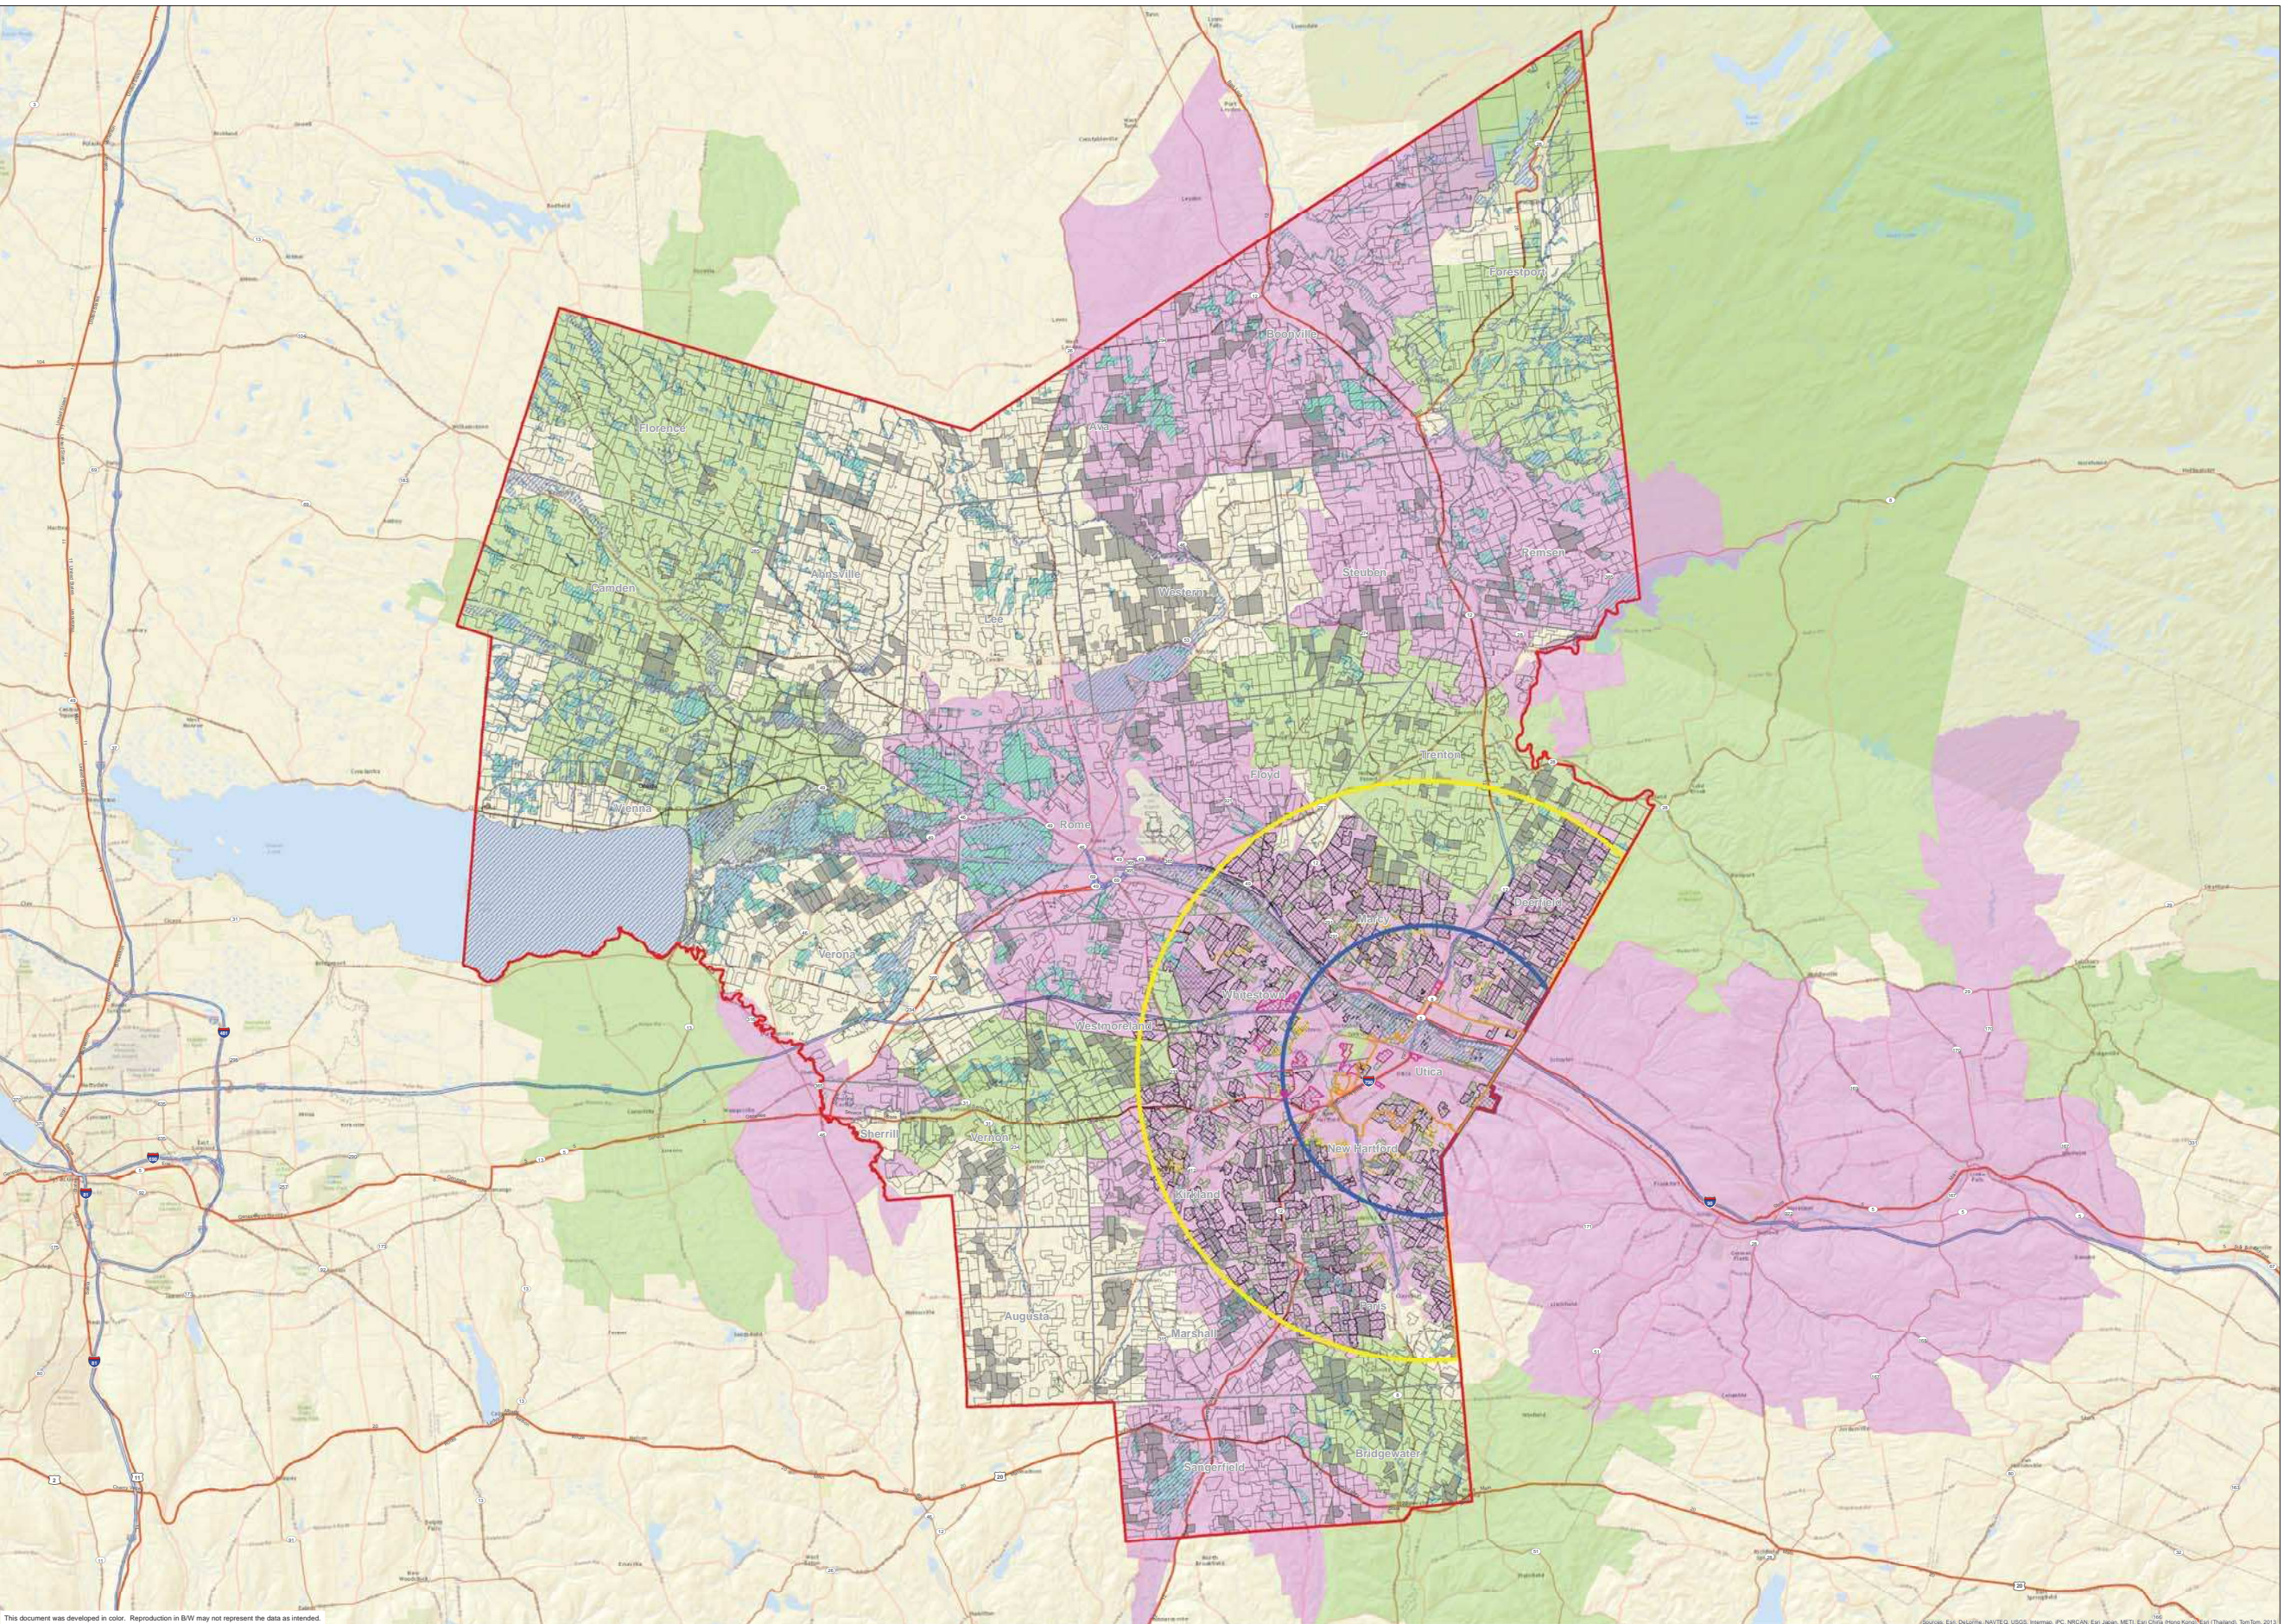

III. County-Wide Site Search

A cursory Geographic Information System (GIS) based site identification survey was conducted to identify 10+ sites for further evaluation. The initial criterion threshold for an acceptable site was single parcels ≥ 50 -acres. Multiple contiguous parcels under singular ownership, which cumulatively met the 50-acre threshold, were not included due to inconsistencies in the method of identifying parcel owners within the GIS. The GIS-based survey was limited to Oneida County parcels although several Herkimer County sites were discussed with decision-makers (*i.e.*, Schuyler Business Park, Frankfort 5S South Business Park). The 'funnel' process did not account for: site control, current site build-out, or existing or past land uses (and associated impacts). The completed GIS map can be found in Exhibit 1.

 PLOT DATE: 06/10/15 10:01:09 AM
 This document was developed in color. Reproduction in B/W may not represent the data as intended.

The following steps were employed to identify sites:

1. Parcels meeting the 50-acre threshold were identified (keyed to a legend) and plotted on a base map, which included:
 - County and municipal boundaries
 - Oneida County property lines (2011)
 - Topographic relief
2. Sites identified in conjunction with the concurrent matrix evaluation were identified on the base map (see Level 2 Analysis):
 - Yahnundasis Golf Club, Seneca Turnpike, New Hartford, NY
 - Twin Ponds Golf Country Club, Main Street, New York Mills, NY
 - New Hartford Business Park, New Hartford, NY
 - Property adjacent to SUNY Polytechnic Institute, fronting onto Route 12 South in the town of Deerfield, NY
 - Sadaquada Golf Club, Whitesboro, NY
 - Hidden Valley Golf Club, Castle Road, Whitesboro, NY
 - Domenico's Golf Course, Church Road, Whitesboro, NY
 - Downtown - generally bounded by Oriskany Blvd on the south, Broadway on the east, State St on the west, and City Hall on the north
 - St. Luke's Hospital Campus, New Hartford
 - NYS Psych Center grounds, Utica, NY
 - Faxton Hospital-Murnane Field Site, Utica, NY
 - Tect Utica, Whitesboro, NY
3. A negative-based "funnel" process was employed to eliminate parcels, which were characterized by unfavorable conditions. Unfavorable conditions are exiting site conditions, which impact the developable acreage and/or increase development costs and "time-to-market." Sites were eliminated from further consideration if developable acreage encroached upon the following conditions:
 - Wetlands (New York State¹ and potential federal²)
 - 100-year floodplain
 - Steep slopes (>15%; created using USGS 10m Digital Elevation Models [DEMs])
4. The following "positive" attributes were overlaid on the "funnel map":
 - MVHS Primary Service Area (PSA)

¹ Based on NYS Freshwater Wetland Maps.

² Based on US Fish & Wildlife Service National Wetland Inventory.

- MVHS Secondary Service Area (SSA)
 - Utility lines (limited)
5. The following radii were overlaid on the “funnel map” to identify potential sites that might be considered as reasonably central to serve PSA and SSA customers.
- 10-mile radius from the approximate geographic center of Utica
 - 5-mile radius from the approximate geographic center of Utica
6. In addition to the matrix-identified sites, the following additional parcels were highlighted on the “funnel map”:
- Parcels ≥ 50 -acres
 - Parcels ≥ 50 -acres within the 10-mile radius and within the PSA
 - Parcels ≥ 30 -acres and < 50 -acres within the 10-mile radius and within the PSA (≥ 30 -acre parcels were added to capture additional urban-centric sites)
 - Parcels, which substantially meet required geographic parameters, as well as those parcels, which are not characterized by “unfavorable” environmental conditions.

IV. Level 1 Analysis

Using the funnel map, the following sites were evaluated for “fatal flaws” that would eliminate the site from further consideration. These are listed in no particular order of preference

1. Yahnundasis Golf Club, Seneca Turnpike, New Hartford, NY
2. Twin Ponds Golf Country Club, Main Street, New York Mills, NY
3. New Hartford Business Park, New Hartford, NY
4. Property adjacent to SUNY Polytechnic Institute, fronting onto Route 12 South, Deerfield, NY
5. Sadaquada Golf Club, Whitesboro, NY
6. Hidden Valley Golf Club, Castle Road, Whitesboro, NY
7. Domenico's Golf Course, Church Road, Whitesboro, NY
8. Downtown - generally bounded by Oriskany Blvd on the south, Broadway on the east, State St on the west, and City Hall on the north
9. St. Luke's Hospital Campus, New Hartford, NY
10. NYS Psych Center grounds, Utica, NY
11. Tect Utica, Whitesboro, NY
12. Faxton Hospital and Murnane Field

For each of these sites, the team evaluated access, utilities, transportation network, and general location to determine if the site warranted a level 2 analysis.

The following 'fatal flaws' were identified:

Yahnudasis Golf Club

- Access Issues:
 - According to NYSDOT, access would be near the existing entrance off of Commercial Drive but it would require a re-configuration of the Route 12 - Genesee Street/Route 12B/Route 5 intersection.
 - The road network has the capacity but there are potential operational issues with restrictions on number of options for ingress/egress.
 - There is a railroad spur that would need to be crossed but it has extremely limited use.
 - Secondary access from Route 840, Route 12 or Commercial Drive is not feasible.
- High Tension Power lines are present
- Mud Creek with associated wetlands impacts a large portion of the golf course site
- New Hartford planning and permitting process
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation
- Site is eligible for listing on National Register and State Register

Twin Ponds

- Adjacent to older well established neighborhoods that might resist 'Not In My Back Yard' (NIMBY)
- New Mills planning and permitting process
- Generally hilly site
- Twin Ponds is a 1950s icon – with some associated history
- Access Issues:
 - Main Street and Burrstone Road have capacity issues. Three-legged intersection with rail crossing is at Main St, Burrstone Road and Clinton St that creates circulation issues.
 - A secondary access from Burrstone Road would require residential property acquisition and there are capacity concerns about access from Burrstone Road.
- No assessment has been made of utility and infrastructure capability and whether additional upgrades would be necessary to serve a hospital use.
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

New Hartford Bus Park

- Access Issues:
 - Operational issues along approach at "Jay – K intersection"

- Capacity and operational issues along Middle Settlement Road
- Woods Highway at Route 5 is not a feasible main entrance
- Creating interchange at Route 840 to allow westbound access to the site would be at a cost of \$20-\$30 million.
- Power lines cut through site, which reduces available acreage.
- New Hartford Planning and Permitting Process
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

Deerfield Property SUNY Poly and Route 12 South)

- North of NYS Thruway – further from population centroid
- Along a divided highway. Traffic from south, west or east would need to travel north on Route 12 and take exit ramp at Mulaney Road to then travel south to enter site.
- Only known access to site is through access road off of Mulaney Road that runs from Bank of America to site. Not clear if access could be provided off of service road parallel to Route 12 or through SUNY Poly.
- Highest and best use of site is for expansion of SUNY Poly
- Site has not been investigated for stream and wetlands that could impact site
- Improvements would be required to bring power to the site.
- No ability to expand site as site is landlocked by Route 12 to east, Bank of America to the north, and SUNY Poly to west and south
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

Sadaquada Golf Club

- Access Issues:
 - Henderson Street has operational and capacity issues
 - Approach would be along Commercial Drive which has the highest traffic volumes in the region
 - Clinton Street and Clark Mills Road also have capacity issues
- Utility and infrastructure availability and capacity not assessed
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

Hidden Valley and Domenincos Golf Course Sites

- Remote Site
- Access Issues:

- North Side of NYS Thruway – further from population centroid
- Access north on 840 past Westmoreland Road
- Lack of secondary access points
- Power lines cut through the site
- No infrastructure at site
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

Tect Utica Site

- Remote Site
- Access Issues:
 - Halsey Road has capacity issues
 - Clark Mills Road has capacity issues
- Potential wetlands
- Power lines
- Infrastructure upgrades needed – sewer upgrade
- Tect Utica may not be compatible – vibrations and noise
- Site is located outside the Major Population Center as required in the 2015-2016 NYS Budget legislation.

Faxton – Murnane Field

- Alienation of park lands required with replacement of Murnane Field required
- City of Utica School District approval required to acquire Murnane Field
- Access Issues:
 - No access from Burrstone Road
 - Burrstone Road and Sunset Avenue have existing capacity issues, which would be compounded with development on Murnane and potentially Pin O Rama sites.
 - Additional Property acquisition would be required – Pin O Rama Block
- Site would require overhead connector with Faxton from Murnane.
- Would need to consider integration of Faxton campus with new hospital complex to determine whether there is value in maintaining Faxton site and using property at Murnane Field and Pin O Rama for expansion.

V. Level 2 Analysis

The design team formulated a detailed site selection matrix that examined a variety of factors necessary for a successful and functioning site that will meet the hospital current and future expansion needs. This section presents the comparative analysis of three preferred sites using the seven evaluation categories listed below:

1. Size
2. Utilities
3. Accessibility
4. Zoning Approvals and Impact Fees
5. Monetary Factors
6. Community Factors, Perception & Sustainability
7. Environmental

Criteria and sub-criteria were established for each category. Each sub-criterion was assigned points with the higher values representing more desirable features or development conditions. The total point value for each category was then weighted so that the maximum achievable score under each category was 10 points. The detailed scoring matrix is provided as Exhibit 2.

A. Site Criteria Matrix

1. Size

Size evaluation was based on the programming guidelines set forth by Hammes in their January 28, 2015 report and adjusting for urban and suburban environments. The Hammes report established a minimum lot size of 11 acres for an urban location and 49 for a suburban location. The points assigned in this section are based on current available acres for development.

Scoring results under the Size Category are as follows:

- Downtown – 7 points
- Psychiatric Center – 10 points
- St. Luke's – 7 points

2. Utilities

Water, sewer, stormwater, electrical, natural gas, and fiber line utilities were evaluated under this category.

Water capacity is sufficient at all three sites. However, static pressures at the Psychiatric Center (approximately 60-70 psi) are less than the static pressures at the other two sites (approximately 90 psi). The Downtown location is also surrounded by older infrastructure that has experienced frequent water main breaks during deep winter frosts. All three sites have good redundancy.

Sanitary and storm sewers are not separated at the Downtown site and the site is not conducive to green infrastructure features. A sewer separation project would need to be planned in advance of hospital construction at this location. The sewer improvement project would need to eliminate stormwater inflow from the combined sewers in this area. Stormwater lines would need to be constructed to separate stormwater flow and direct it under the main rail lines to the north and then to the canal.

None of the sites are in the “downtown electrical network,” which would likely prohibit the development of a Combined Heat and Power facility (CHP). Natural gas is likely available near each site at the appropriate capacity for a gas turbine CHP system, however, the level of system improvements necessary to deliver this volume of gas is not yet determined.

The Downtown site has the potential to be the better site among the three for power delivered from the electrical grid. This downtown site is relatively close to National Grid’s Terminal substation located to the north at Harbor Point. The Terminal station has two transformers and distribution buses. As a result, it functions in a manner similar to two separate substations.

National Grid would need to explore the possibility of running two dedicated 13.2 kv underground cables to the new hospital. This would provide a high level of reliability since the cables would serve only the hospital, be relatively short in distance, and have no exposure to the factors that impact overhead lines.

While the other sites (Psych Center and existing St. Luke’s campus) can be fed from two 13.2 kv lines, as well, the lines would run above ground and would not be dedicated and there is a question whether they could handle the loads.

Regarding St. Luke’s, there are also two 46 kv circuits at the intersection of Main Street, Clinton Street and Burrstone Rd in New York Mills. Lines could be run from this intersection to St. Luke’s which would improve the reliability at this location.

Scoring results under the Utilities Category are as follows:

- Downtown – 6 points
- Psychiatric Center – 8 points
- St. Luke’s – 8 points

3. Accessibility

Accessibility was reviewed both from the distance to NYS Routes and the NYS Thruway. The NYS Routes included:

- North-South Arterial including Route 840 Section
- Oriskany Street/NYS Route 5A/ NYS Route 5S
- NYS Route 49
- Non-arterial sections of NYS Routes 5 and 12

In addition, likely road and signal improvements were reviewed with NYSDOT Region 2. The Downtown location has the potential benefit of being planned in conjunction with the Department's Oriskany Street/5S project so that the access needs of the Hospital from Oriskany Street could be incorporated into the project. NYSDOT expects this project to be constructed in 2018.

It is anticipated the Psychiatric Center location would require improvements along the Jason Street and Court Street corridors to improve access. For the St. Luke's location, signal improvement would be anticipated at Burrstone Road and Champlin Avenue intersection.

Travel distance for employees was scored by reviewing zip code data of the employees to determine an approximate centroid of the base employment zone. The intersection of the North-South Arterial and the East-West Arterial (Route 8 and 840) was used as this centroid.

Based on a preliminary review of incorporating a heliport into the new facility, there does not appear to be any overriding deficiencies, which would promote one site over another in reference to this criteria. Helicopter access is essentially design-driven including approach and departure procedures, which require two unobstructed flight paths in and out from the heliport. For safety reasons, roof-top heliports are recommended by the FAA. Coordination with municipal planners and zoning commissions are necessary to promote proper zoning, as well as safeguards to prevent future development from interfering with approved flight paths. The design should plan for growth, and account for proximity to sensitive receptors.

With regard to visibility, the downtown site is the only sight with direct sight lines to State routes.

Scoring results under the Accessibility Category are as follows:

- Downtown – 9 points
- Psychiatric Center – 5 points
- St. Luke's – 6 points

4. Zoning Approvals and Impact Fees

Basic zoning was reviewed for each site to determine if the hospital is an allowed use as of right and what the lot coverage and height requirements are. The zoning ordinances for the City of Utica and the Town of New Hartford were reviewed. While there are other components to zoning, these three regulations provide the ability to determine if a zoning change or enacting a Planned Unit Development would be warranted.

Zoning for the downtown site and the St. Luke's campus are adequate and in place. For the downtown site, the hospital is an allowed use with a special permit, the lot coverage allowed is 100%, and there are no height restrictions.

The St. Luke's campus has a planned development district in place so no zoning changes would be required, but development would be subject to site plan approval by the Town. The hospital on the Psych center site is an allowed use by special permit the lot coverage and height restrictions would not be sufficient for the hospital's requirements therefore a zoning change would be required.

The additional sub-criteria relates to sewer offset requirements. Development projects that are in service area of the Sauquoit Creek Pumping Station (SCPS) require flow credits in place before they can proceed because of

stormwater inflow and Infiltration issues in this basin. The SCPS basin generally follows municipal borders. The towns of Whitesboro and New Hartford are inside the SCPS basin and the City of Utica is out.

Flow credits are established by tracking the amount of stormwater removed from the sanitary sewer system during a one-year, 24-hour storm and dividing that volume by 5. The flow credits, assuming they are available from the municipality, are then applied against the anticipated gallons per day of sewer flow of the pending development. In contrast, development within the City of Utica is not currently not subject to sewer offset requirements but may be under similar restrictions by 2017 but only at a 2:1 offset ratio. Although the St. Luke's site is in New Hartford, the majority of its sewer discharges enter the City's sewer system. Assuming the connection to the City's system would remain, new development at the St. Luke's site would be viewed as outside the SCPS basin.

Scoring results under the Zoning Approvals and Impact Fees Category are as follows:

- Downtown – 8 points
- Psychiatric Center – 5 points
- St. Luke's – 8 points

5. Monetary Factors

Site assembly was reviewed, in general terms, based on the number of properties involved in land acquisition. Further, some consideration was given to additional investment potential based on the site location and the project's relation to broader downtown revitalization, neighborhood revitalization, and/or preservation features. These same interests could also result increased fundraising. This is not meant to include the \$300 million allotted under the State budget. At this time, all Level 2 sites are deemed equal with regard to their status in terms of the budget item.

Constructability issues were weighed with regard to demolition, geotechnical, and phasing elements of the project. With regard to demolition, all sites will require 2 to 4 acres of demolition and judged equal for this level of analysis. Geotechnical conditions are likely preferable at the Psychiatric Center and St. Luke's sites. However, further geotechnical studies will be needed to determine how these conditions will translate to the cost of foundation construction. The St. Luke's site presents a challenge with regard to construction phasing. The existing operations will need to be maintained and protected during the construction of the new facility. A myriad of issues would need to be explored with regard to employee access, construction access, circulation, noise, vibrations, etc. if the new hospital is to be located at the current St. Luke's campus.

The Downtown site has the added benefit of utilizing some percentage of shared public parking which may offset some operational costs.

Sanitary sewer discharges from the St. Luke's site predominately flow into the City of Utica's combined sewer system and therefore not subject to additional sewer fees established under the Sanitary Sewer Overflow (SSO) Mitigation Program to implement improvement projects in the SCPS basin.

Scoring results under the Monetary Category are as follows:

- Downtown – 5 points
- Psychiatric Center – 6 points

- St. Luke's – 4 points

6. Community Factors, Perception & Sustainability

This section of the matrix evaluated existing community policy documents, whether or not the site was in an existing neighborhood, and if there are sustainability features that could be implemented.

For the community policy document the sites were examined to determine if they are consistent with an existing comprehensive or master plan and if the site is within or adjacent to an existing or proposed Brownfield Opportunity Area (BOA). All three sites are consistent with a master plan and only the downtown and Psychiatric Center are near a proposed BOA. Being adjacent or within a BOA can be helpful in obtaining state funding if the project is consistent with the BOA planning document.

The next sub-criteria examined the location of site in relation to the surrounding neighborhood. The downtown site is the only site not situated near a neighborhood whereas St. Luke's and the Psychiatric Center are near neighborhoods but a buffer is possible.

The final sub-criteria examined sustainability features as it relates to the ability to provide a microgrid and if it can be considered an urban infill project (vs. greenfield development). The Central Utility Building at the Downtown and Psychiatric Center sites have the potential to serve as microgrid power sources. CHP's themselves are considered a more sustainable for generating electric power option versus relying 100% on the electrical grid. CHP are more energy efficient and rely on cleaner sources (i.e. gas turbines) reducing emissions of carbon dioxide and other air pollutants in comparison to regional power stations.

Finally, consideration was given to Downtown and Psychiatric Center sites for re-purposing urban parcels for re-use which is considered a sustainable initiative as higher densities in the urban environment minimizes the need for energy, allows for non-motorized types of transportation, and increases the efficiency for the delivery utilities and services. All three site options would likely comply with the State's Smart Growth Development Policy, but the Downtown and Psychiatric Center would be viewed more favorably if state funds are pursued to assist with the development of either of these sites.

Scoring results under the Community Factors, Perception & Sustainability Category are as follows:

- Downtown – 10 points
- Psychiatric Center – 8 points
- St. Luke's – 4 points

7. Environmental

For this portion of the matrix the following factors were evaluated: 100-year floodplain, cultural resources, wetlands, steep slopes (amount of land with less than 15% slope), and endangered and threatened species. All 3 sites are not located in a 100-year floodplain. Only the St. Luke's site is not listed or eligible for listing on the State and/or Federal Register; it is also not located within an archeologically sensitive area. None of the sites encroach upon state wetlands or the buffer area; St. Luke's does encroach upon a potential federal wetland. All 3 sites are relatively flat and none of the sites will have restrictions for clearing as it relates to the Indiana Bat and other endangered species.

Development of the Psych Center and Downtown sites will require coordination with the State Historic Preservation Office (SHPO). Buildings on the Psych Center campus, particularly Old Main, will be subject to

review on the renovation and reuse of these buildings, and any demolition that may be part of the hospital redevelopment. The capacity analysis shows integration of Old Main into the proposed redevelopment program, which likely would receive favorable support from SHPO. The Downtown site would require demolition of all buildings within the defined property boundaries for the hospital. This will require coordination with SHPO. However the downtown option will also create opportunities to catalyze development of key downtown buildings that lie on the periphery of the hospital development (*e.g.*, Hotel Utica, E. Tudor Williams Building, Utica Paint Buildings, as well as key buildings along the Genesee St. corridor).

- Downtown – 8 points
- Psychiatric Center – 8 points
- St. Luke’s – 9 points

B. Matrix Summary

The final scoring for the 3 sites is as follows:

- Downtown – 53 points
- Psychiatric Center – 50 points
- St. Luke’s – 46 points

DRAFT

EXHIBIT 2
SITE SELECTION MATRIX

I. SIZE		Total Potential Points - 6 Points		
		Downtown	Psych Center	St. Luke's
A. Urban	1) Urban - between 10 and 20 acres (2 points)			
	2) Urban - between 20 and 30 acres (4 points)	4		
	3) Urban - greater than 30 acres (6 points)		6	
B. Suburban (within 5 miles of City Center)	1) Suburban - between 20 and 30 acres (2 points)			
	2) Suburban - between 30 and 40 acres (4 points)			4
	3) Suburban - greater than 40 acres (6 points)			
SUBTOTAL:		4	6	4
WEIGHTED SUBTOTAL: Weight (10/6) = 1.67		7	10	7

II. UTILITIES		Total Potential Points - 32 Points		
A. Sanitary Sewer	1) Capacity improvements require less than 500 linear feet of upgrades (4 points)		4	4
	2) Capacity improvements require between 500 and 1000 linear feet of upgrades (2 points)	2		
	3) Capacity improvements require more than 1000 linear feet of upgrades (0 points)			
B. Potable Water	1) Capacity improvements require less than 500 linear feet of upgrades (4 points)	4	4	4
	2) Capacity improvements require between 500 and 1000 linear feet of upgrades (2 points)			
	3) Capacity improvements require more than 1000 linear feet of upgrades (0 points)			
	4) Redundancy: 2 main feeds from different reservoirs/tanks + 2; 2 main feed from same source +1 points	2	2	2
	5) Potential useful life or pressure issues (minus 1 to -2 points)	-1	-1	
C. Electrical	1) Adequate Capacity: Currently available +2 points; need National Grid upgrade + 1 point	2	1	1
	2) Redundancy: 3 independent sources +2 points; 2 sources + 1 points	1	1	1
	3) Reliability: reliable dedicated feeder +2 points; reliable shared feeder +1 points	2	1	1
	4) Service voltage: 115Kv +2 points; 34.5 Kv +1 points; <15Kv + 0 points	2	0	1
D. Natural Gas	1) Capacity: supports hospital w/ future CHP +4 points; supports hospital only +2 points	4	4	4
	2) Upgrades: services extensions >500 feet minus 2 points; >1000 feet -4 points	TBD	TBD	TBD
E. Fiber Network Availability	1) Yes (2 points)	2	2	2
F. Storm Drainage	1) Separate storm sewers onsite (+2 points)		2	2
	2) Soils and depth to water table conducive to green infrastructure (+2 points)		2	2
	3) Property available for onsite detention (+2 points)		2	2
SUBTOTAL:		20	24	26
WEIGHTED SUBTOTAL: Weight (10/32) = .3125		6	8	8

III. ACCESSIBILITY		Total Potential Points - 22 Points		
A. Major Roads	1) Between 0 and 0.5 miles from N-S Arterial including 840 section (+4 points)	4		4
	2) Between 0 and 1.0 miles from N-S Arterial including 840 section (+2 points)		2	
	3) Between 0 and 0.5 miles from Oriskany Street/5A/5S (+2 points)	2	2	
	4) Between 0 and 0.5 miles from other NYS Routes - Route 49, non-arterial sections of Routes 5 and 12 (+2 points)			
B. NYS THRUWAY	1) Between 0 and 1 mile (4 points)			
	2) Between 1 and 2 miles (3 points)	3		
	3) Between 2 and 3 miles (2 points)		2	
	4) Between 3 and 4 miles (1 points)			1
	4) >4 miles (0 points)			
C. Road and Signal Improvements	1) -1 for each 1000 ft length of road improvement and -1 for each signal improvement		-3	-1
D. Public Transit	1) Yes (4 points)	4	4	4
	2) No (0 points)			
E. Flight Services (helicopter)	1) Allowed and no flight path restrictions (+2)	2	2	2
	2) Not allowed and/or significant flight path issues identified (0 points)			
F. Visibility	Can be seen from a NYS Route or Interstate (+ 2 points)	2		
G. Distance to majority of Employee Base (using approximate zip code centroid of Utica, Whitesboro, New Harford, and Clinton i.e. approximate N-S arterial and E-W arterial interchange)	1) Between 0 and 2 mile (4 points)			4
	2) Between 2 and 4 miles (2 points)	2	2	
	3) > 4 mile (2 points)			
SUBTOTAL:		19	11	14
WEIGHTED SUBTOTAL: Weight (10/22) = .455		9	5	6

IV. ZONING APPROVALS AND IMPACT FEES		Total Potential Points - 6 Points		
A. Basic Zoning	1) Allowed use, lot coverage, and building height (+1 to +3 points)	3	1	3
B. Sewer Offset Requirements	1) No (3 points)			
	2) No - Utica and north system may be subject to 2 to 1 offsets starting 2017 (2 points)	2	2	2
	3) Yes - Sauquoit Creek Pump Station is subject to 5 to 1 offsets (0 points)			
SUBTOTAL:		5	3	5
WEIGHTED SUBTOTAL: Weight (10/6) = 1.67		8	5	8

Downtown
Psych Center
St. Luke's

V. MONETARY FACTORS **Total Potential Points - 20 Points**

A. Site Assemblage	1) Property acquisition involves multiple parcels (0 points)	0		
	2) Property acquisition involves one primary owner (2 points)		2	
	3) Property currently under Owner's control (4 points)			4
B. Attract Additional Outside Investment	1) Based on Downtown Revitalization (+ 4 points)	4		
	2) Based on other factors - neighborhood revitalization; preservation features (+2)		2	
C. Cost of Construction - Phasing	1) Must maintain access and protect existing facilities during construction (0 points)			0
	2) Off-site construction with immediately adjacent buildings (2 points)	2		
	3) Off-site construction with wide construction zone (4 points)		4	
C. Cost of Construction - Foundations	1) Soft soils and/or high water table (0 points)			
	2) Harder soils (2 points)		2	2
D. Cost of Construction - Demolition	1) No demolition (4 points)			
	2) Demolition of <2 acres needed (2 points)			
	3) Demolition of >2 acres needed (0 points)			
E. Nearby public parking	Ability to utilize public parking facilities (+ 2)	2		
F. Sauquoit Creek PS Basin Surcharges	No (+ 2)	2	2	2
SUBTOTAL:		10	12	8
WEIGHTED SUBTOTAL:		5	6	4

Weight (10/20) = .5

Downtown
Psych Center
St. Luke's

VI. COMMUNITY FACTORS, PERCEPTION & SUSTAINABILITY		Total Potential Points - 16 Points		
A. Community Priority Site/Area	1) Consistent with Master Plan (+4 points)	4	4	4
	2) Within or adjacent to proposed/existing Brownfield Opportunity Area (+2 points)	2	2	
B. Proximity to Existing Neighborhood	1) Not within residential neighborhood (4 points)	4		
	2) Within neighborhood but buffer zone is possible (2 points)		2	2
	3) Within neighborhood and no buffer zone (0 points)			
C. Sustainability and Resiliency Features	1. Potential Microgrid opportunity (+2 points)	2		
	2) Smart Growth - represents retrofitting/urban infill project (+4 points)	4	4	
SUBTOTAL:		16	12	6
WEIGHTED SUBTOTAL:		10	8	4
		Weight (10/16) = .625		

VII. ENVIRONMENTAL		Total Potential Points - 8 Points		
A. 100-year Floodplain	1) Project site/footprint is not located within 100-year floodplain (2 points)	2	2	2
B. Cultural Resources	1) Project is not located on a site listed or eligible for listing on the SR/NR (1 point)			1
	2) Project is not located within an archaeologically sensitive area (1 point)			1
C. Wetlands	1) Project does not encroach upon potential federal wetlands (based on NWI or delineation) (1 point)	1	1	
	2) Project does not encroach upon State wetlands or buffer (1 point)	1	1	1
D. Steep Slopes	1) No slopes >15% (1 point)	1	1	1
E. Endangered & Threatened Species	1) No tree clearing restrictions due to Indiana Bat/Northern Long-eared Bat (1 points)	1	1	1
SUBTOTAL:		6	6	7
WEIGHTED SUBTOTAL:		8	8	9
		Weight (10/8) = 1.25		

TOTAL WEIGHTED SCORE:	53	50	46
------------------------------	----	----	----

VI. Capacity Analysis

For the top 3 selected sites, a capacity analysis was undertaken. Using the program of uses defined above, refined, and summarized here, the design team reviewed the sites and located the hospital, two patient towers, parking, and in the case of the downtown and Psych Center sites, evaluated circulation patterns. Depending on the size of the parcel both surface and structured parking was evaluated.

Facility Program

Hospital 850,000 square feet: (375,000 SF for Administration and Operations and 510,000 SF for patient rooms)

Medical Office Building 24,000 SF

Parking 3,000 stalls (Approx.)

Each of the program elements on the drawings are labeled and detailed information is provided including number of floors and square footage of the hospital (Administration, Surgical, Emergency), patient room towers, and for the Medical Office Building (MOB), a central utility building, and detailed information on the number of parking stalls whether surface or structured.

ST. LUKE'S SITE

The design team examined the St. Luke's campus (see Exhibit 3.) Given the current utilization of the site and some site constraints due to wetlands, there is a challenge to incorporate the required building configuration for the new consolidated campus within the existing property boundaries. The capacity analysis shows the new development wedged within the most constrained portion of the site due to the presence of the main hospital complex and Skilled Nursing Facility. Also, to meet the required number of parking spaces, a parking structure was added to this concept. Primary access to the campus is realigned with Champlin and the existing nursing home is retained.

- Hospital (Administration, Surgical, Emergency): 180,000 SF/floor at 2 stories, plus a 10% expansion area (dashed line)
- Patient Room Tower #1: 30,000 SF/floor at 9 floors
- Patient Room Tower #2: 30,000 SF/floor at 9 floors
- Medical Office Building: 12,000 SF at 2 stories, plus a 10% expansion area at 1,200 SF (dashed line)
- Surface Parking: 1,937 stalls
- Parking Garage: 3 Decks for 1,162 stalls with 387/Floor

DOWNTOWN SITE

The downtown site was examined for its ability to fit all of the program elements (see Exhibit 4.) In addition to locating the facilities and parking, the design team examined access points and circulation into and surrounding the site for staff, patients, and emergency vehicles. Because this project will likely be a public/private undertaking, the downtown capacity plan is showing the larger project area (solid yellow line) and the area dedicated for hospital operations (dashed yellow line.) The total acreage of the downtown site is 34 acres with 17 acres dedicated for hospital operations.

Two parking structures are indicated on the plan with an overhead building connector. Some surface parking is located adjacent to the hospital. Additional commercial and mixed-use structures are shown off-site that will likely be private undertakings separate from the hospital. The intent is to show how this area of downtown can be rebuilt with the hospital and other private interests.

As illustrated, the orientation of the hospital is on the eastern portion of the study area so that it is closer to Utica's central business district. The primary entry point would be from Columbia, with emergency access on the western portion of the site.

Hospital Operations

- Hospital (Administration, Surgical, Emergency): 115,000 SF/floor at 3.5 stories, plus a 10% expansion area (dashed line)
- Patient Room Tower #1: 30,000 SF/floor at 9 floors
- Patient Room Tower #2: 30,000 SF/floor at 9 floors
- Medical Office Building: 24,000 SF at 3 stories, plus a 10% expansion area at 8,000 SF (dashed line)
- Central Utility Building
- Surface Parking: 621 stalls including 32 convenience parking spaces at the main entrance

Public/Private Sector Initiatives

- Parking Garage #1: 8 Decks with 808 total stalls (101/Floor). The garage could be expanded if the program is expanded onto a portion of the Hotel Utica site, which would retain Washington Avenue but have parking on floors 2-8 with the extension onto the Hotel Utica block.
- Parking Garage #2: 8 Decks with Commercial services in 60% of first floor with 40 stalls. For floors 2-8 there are a total of 1,447 total stalls (206/Floor). Total stalls – 1,487
- Parking Garage #3: 3 Decks (floors 2-4) for a total of 450 stalls. This is a mixed-use building with parking integrated on floors 2-4.
- Mixed-Use Commercial Residential Building with first floor retail, floors 2-4 parking, and floors 5 and 6 residential.
- Commercial Development Areas (x2)

PSYCH CENTER

The Psych Center property, owned by NY State, was evaluated (see Exhibit 5). The resulting concept utilized 'Old Main' which is listed on the National Register of Historic Places as the primary focal point. As shown on the diagram, the hospital would be attached to the south side of 'Old Main' via an atrium. The patient towers would connect to the south side of the hospital and two parking structures would be located on the west side of the property but an adequate distance from the neighborhood so as not to impose a visual impact.

Circulation in the property would primarily be along the western portion of the property. Primary access to the site is from Court Street and it is proposed that Jason Street be reconstructed to connect directly with Oriskany (NYS 5s.) This would provide direct access from the primary east-west route through the City of Utica.

Given the amount of land that is available at this location, this concept proposes a campus style senior living facility similar to Acacia Village located on the Mason's campus in the City. This would provide the ability for seniors, not needing assisted care, to live in the city able to walk to various venues and have access to health care.

- Hospital (Administration, Surgical, Emergency): 180,000 SF/floor at 2 stories, plus a 10% expansion area (dashed line)
- Patient Room Tower #1: 30,000 SF/floor at 6 floors
- Patient Room Tower #2: 30,000 SF/floor at 6 floors
- Patient Room Tower #3: 30,000 SF/floor at 6 floors
- Medical Office Building: 12,000 SF at 2 stories, plus a 10% expansion area at 1,200 SF (dashed line)
- Central Utility Building
- Surface Parking: 1,571 stalls
- Parking Garage #1: 4 Decks with 724 total stalls (181/Floor)
- Parking Garage #2: 4 Decks with 535 total stalls (134/Floor)
- Also shown: Campus senior living that could be a private undertaking in association with the hospital. This would be small clusters of housing units, single story living, low square footage. The idea is to provide housing options for empty nesters still looking to reside in the City of Utica.

1.0 Introduction

1.1 PROJECT DESCRIPTION

Panamerican Consultants, Inc. (Panamerican) was contracted by O'Brien & Gere Engineers, Inc. (OBG) to conduct a Phase 1A cultural resources investigation for the proposed Mohawk Valley Health System (MVHS) Utica Hospital in the City of Utica, Oneida County, New York. This report includes the background research and archaeological sensitivity assessment for the approximately 25-acre (81± parcels) Area of Potential Effect (APE).¹ For this study, the APE is the Project location, which is generally bounded to the west by the North-South Arterial Highway, to the east by Broadway, to the south by Columbia Street, and to the north by Oriskany Street; an area encompassing approximately 25 acres (Figures 1 and 2). The Project would result in substantial demolition and new construction within a majority of the APE, as well as the need to eliminate Lafayette Street between State Street and Broadway. Figure 3 presents an architectural site plan (30 percent design) depicting the proposed hospital facilities.

The purpose of the Phase 1A investigation is to identify previously recorded cultural resources that may be impacted by the proposed project and to assess the likelihood that unrecorded resources may be present within the APE of the proposed project (New York Archaeological Council [NYAC] 1994). The cultural resources investigation included documentary and historical map research, a site file and literature search, the examination of properties listed in the New York State and National Registers of Historic Places (S/NRHP), preparation of prehistoric and historic contexts of the project area, assessment of cultural resources sensitivity and past disturbances at the site, a walkover reconnaissance, and photographic documentation of field conditions. Photographs of the field investigation are presented in Appendix A.

The cultural resource investigation was conducted in compliance with the National Historic Preservation Act (as amended), the National Environmental Policy Act, the New York State Historic Preservation Act, and the State Environmental Quality Review Act, as well as all relevant federal and state legislation. The field investigation was conducted by Ms. Christine Longiaru, M.A., during March 2018. Robert J. Hanley, M.A., RPA, served as the Principal Investigator, Mr. Mark A. Steinback, M.A., served as Project Historian; and Dr. Michael A. Cinquino, RPA, served as Project Director.

1.2 METHODOLOGY

Cultural resources investigations are designed to provide a complete examination of a project area in order to identify and assess any known or unknown cultural resources prior to potential impacts. These resources include archaeological sites (prehistoric and historic) and standing structures or other aboveground features. As noted, a Phase 1A survey consists of a background and literature search, a site file check, and a field inspection of the project area. Archaeological and historic site files at the New York State Office of Parks, Recreation, and Historic Preservation (OPRHP) are reviewed through New York State Historic Preservation Office's (SHPO) Cultural Resource Information System (CRIS) as an initial step to determine the presence of known archaeological sites within a one-mile radius of the APE. These files include data recorded at both the OPRHP and the New York State Museum (NYSM). Results of the site file check are summarized in Section 2.3.1. The prehistory and history of the region are reviewed for the preparation of an historic context of the APE (see Sections 2.2.1 and 2.2.2).

Information collected during the Phase 1A survey is used to assess the sensitivity of the project area / APE for the presence of cultural resources. The sensitivity of the project area is assessed through background research and field examination. Pedestrian or walkover reconnaissance surveys are conducted across the project area to identify testable locations, cultural features, surface visibility, soil

¹ Panamerican also conducted a separate Phase 1A architectural study, which will be submitted to the New York State Office of Parks, Recreation, and Historic Preservation.

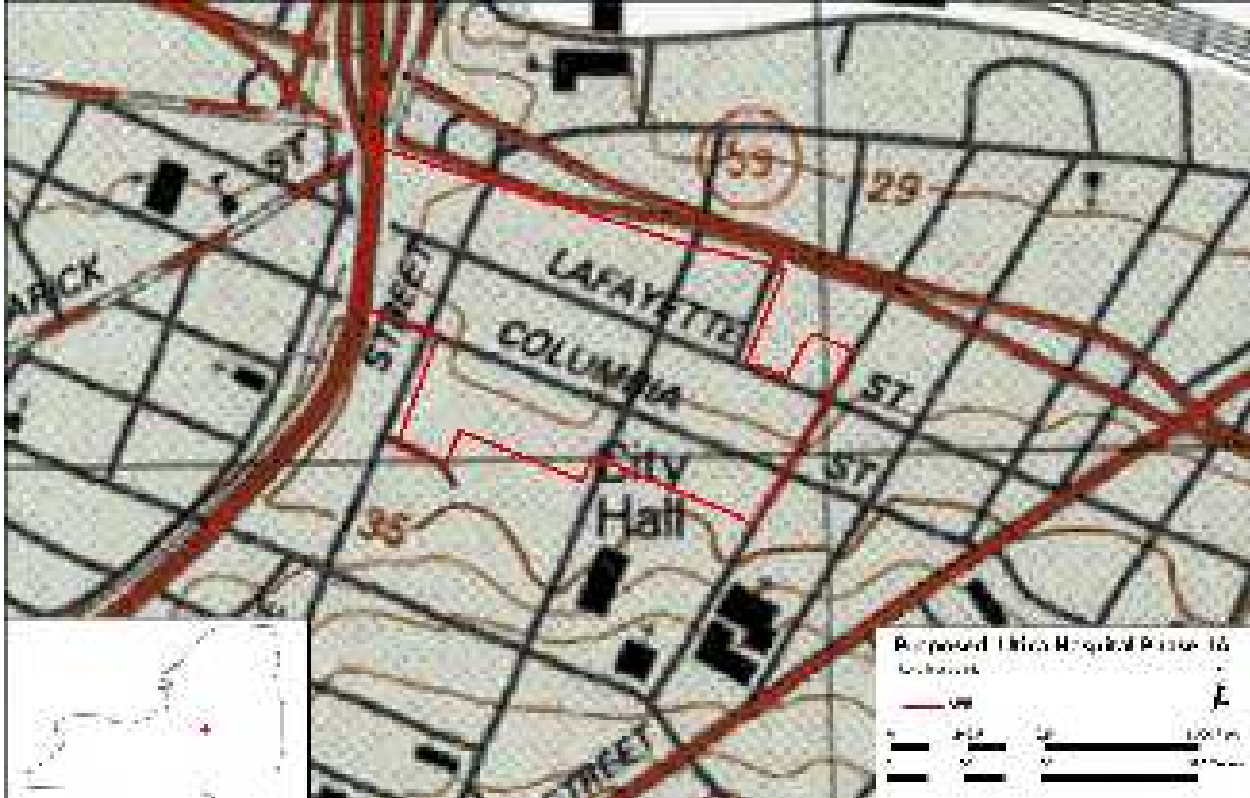

Figure 1. General Project location in the City of Utica, Onieda County, New York (United States Geological Survey [USGS] Utica East 1983).

disturbance, and wet or poorly drained areas, as well as well-drained sensitive areas that would require testing. Areas that are untestable or severely disturbed are identified according to the following criteria:

- graded and cut areas through surrounding terrain (e.g., hills or gorges), such as those resulting from road construction or as pertinent to this location, grading associated with golf course construction;
- areas that appear to have over 5 feet (1.5 meters) of fill;
- areas previously impacted by construction of utilities, drainage ditches, streets or other obvious areas of significant earth movement;
- areas including poorly drained soils and wetlands; and,
- areas having slopes greater than 15 percent.

Areas of archaeological potential and high sensitivity are identified based on the following criteria:

- undisturbed areas that are environmentally sensitive with relatively level well-drained soils or in the vicinity of potable water such as springs, streams or creeks (these characteristics typify known site locations in the region);
- known prehistoric or historic site locations within or adjacent to the project area;

Figure 2. Aerial view of the general Project location in the City of Utica, Onieda County, New York (Google).

- historic structures identified within or immediately adjacent to the project area; and
- the presence of map documented structures (buildings that appear on historic maps but are no longer extant).

Figure 3. Architectural site plan (30 percent design) for the proposed Utica Hospital, City of Utica, New York (nbbj 2017).

2.0 Environmental Setting and Cultural Background

2.1 ENVIRONMENTAL SETTING

Topography. The project area lies within the Hudson-Mohawk Lowlands physiographic province (Cressey 1966:26; Stein et al. 2008:6-7), a valley system between 10 and 30 miles wide that includes the Mohawk and Hudson rivers. The project area occupies a terrace above the Mohawk River flood plain, approximately 2,200 feet (671 meters) south of the Mohawk River. The topography is fairly level, and elevations within the project area range between 95 and 115 ft (29 and 35 m) AMSL increasing to the south (see Figure 1). The project area is within the City of Utica.

Geology. Except for the rocks of the Adirondacks, Oneida County is underlain primarily by Paleozoic sedimentary rocks that dip to the southwest at approximately 50 feet per mile. In generally east-west trending zones, the rocks become younger from north to south across the county. The Mohawk River Valley and the project area are underlain by Middle Ordovician Utica shale (Stein et al. 2008:4-8). This soft shale has been cut through by the Mohawk River to a depth of about 1,000 ft (305m) (Cressey 1966:29-31).

Soils. Specific soils within the project area are summarized in Table 1 and shown in Figure 4 (Stein et al. 2008; Natural Resources Conservation Service [NRCS] 2017). Soils in the project area include Alton gravelly loam, 0 to 3 percent (350A) and Urban land. Note nearby soils 350B and 350C are also Alton gravelly loam, although with steeper slopes. As a result, the area classified as Urban Land may also be Alton gravelly loam that has been paved or leveled to some degree to accommodate construction (see Figure 4).

Table 1. Soils within the project area.

Name	Soil Horizon Depth in (cm)	Color	Texture	Slope %	Drainage	Landform
Alton gravelly loam (350A)	0-9 (0-23) -24 (-61) -40 (-102) -58 (-147) -72 (-183)	DK BR YL BR YL BR YL BR DK YL BR	GV LO V GV F SA LO V GV SA LO V GV SA LO V GV LO SA	0-3	Somewhat excessively	High terraces <1,000 ft
Urban land (23)	NA	NA	NA	0-3	NA	NA

Key: BR = brown, DK = dark, F = fine, GV = gravelly, LO = loam, SA = sandy, V = very, YL = yellow

Drainage. As noted, the project area is 2,200 ft (671m) south of the Mohawk River. Historically, the area has noted as low and swampy. The nearly two centuries of construction and development within this section of the City of Utica, as well as the existing buildings and roadways, have altered any natural drainage patterns.

Forest Zone. The project area is located in Northern Hardwood forest zone. This zone occurs in higher elevations away from the Finger Lakes (de Laubenfels 1966:92). Not uniform, the Northern Hardwood zone consists of a variety of species, but dominated by beech and sugar maple. In cooler areas, the third most prevalent tree is yellow birch. Though not evenly distributed, all types of evergreens are abundant among hardwoods in the cooler regions, the most popular of which include hemlock, white pine and white cedar. The number of hemlock trees was greatly reduced during the nineteenth century by lumbermen for the bark was a source of tannin. Interspersed amid farmland, this zone characterizes the area as it probably was just prior to clearing in the nineteenth century (de Laubenfels 1966:95-96).

Figure 4. Soils within and in proximity to the approximate project area (in red) (NRCS 2017).

2.2 CULTURAL BACKGROUND

2.2.1 Prehistoric Period. The three major cultural traditions manifested in central New York State during the prehistoric era were the Paleo-Indian, Archaic, and Woodland. Cultural development of the area can be summarized as a gradual increase in social complexity, marked by several important cultural or technological innovations.

Paleo-Indian Period (ca 12,000-8000 BC). Hunter-gatherer bands of the Paleo-Indian culture were the first humans in New York State after the last glacial retreat approximately 14,000 years ago. At this time, Lake Ontario and the St. Lawrence River were locked in ice, and the project area may not have been an ideal environment for occupation (Fitting 1975:27). As the climate gradually became more temperate, forays into the region by Paleo-Indians likely became more extended.

Adapted to the tundra, Paleo-Indians utilized a nomadic settlement system in which their movements followed that of game. The archaeological record suggests that Paleo-Indian subsistence strategies emphasized hunting big game species, many of which are extinct. These included mastodon, mammoth, great beaver, caribou, and moose-elk, along with a variety of smaller game (Funk 1972:11; Ritchie 1980; Salwen 1975). In this part of New York State, the remains of mammoths, mastodons, and beaver have been found south of Oneida Lake in Madison County (Ritchie 1980:10-11).

During the seasonal resource peaks, larger populations occupied strategically located base camps; and during periods of scarce resources, the population dispersed, occupying small camps and rockshelters on a temporary basis. Located near the margin of extinct glacial lakes, many Paleo-Indian sites in the Northeast are situated on elevated areas “where good drainage, meaning a dry living floor, was an important consideration” (Funk 1978:18). These hills or rises also served as loci for monitoring the migratory patterns of game species. No Paleo-Indian sites have been excavated in the vicinity of the project area (Ritchie 1980). This general Paleo-Indian adaptive pattern overlapped the beginning of the

subsequent Archaic period, leading some to refer to the earlier periods of the Archaic as a transitional stage.

Archaic Period (ca. 8000-1000 BC). The Archaic period is differentiated from the Paleo-Indian period by a functional shift in lithic technology, an apparent increase in population, changes in the subsistence strategy, and a less nomadic settlement system (Funk 1978; Tuck 1978). These changes reflect an adaptation to an improved climate and a more diversified biome (Funk 1972:10).

Despite evidence that Early and Middle Archaic cultures occupied Central New York, excavations have not been carried out on sites primarily related to these periods. Archaeological sites from these periods are rare and poorly understood, important sites from the Early and Middle Archaic have been found in eastern New York, in Ulster County, and near Sylvan Lake, as well as western Connecticut, the upper Delaware valley, and the Susquehanna valley (Dent 1991; Funk 1991, 1993; Nicholas 1988).

People began to develop woodworking tools during this period, using coarse-grained stones and river cobbles as their raw materials (Kraft 1986). Sites from these periods cluster along major rivers and marshy, swampy land as well as lowlands. Hunting, fishing, and gathering remained the principal daily activities, although greater emphasis was placed on deer and small game like birds and turtles, shellfish, nuts and possibly wild cereal grains. Associated with the shift in subsistence strategies was the increase in population densities, and as population increased, camps became larger and more numerous. Bands moved seasonally or when resources dwindled (Ritchie and Funk 1973).

Most sites of the Late Archaic period were seasonal, special purpose habitation sites. These included winter hunting camps, spring fishing stations, fall nut-gathering and processing stations, and shellfish processing. Principal settlements, such as Frontenac Island, Lamoka Lake, and Brewerton at the western end of Oneida Lake, were mostly in the northern part of central New York, and the north ends of the Finger Lakes. They were located near major rivers or lakes and were multi-activity spring and summer villages (Ritchie and Funk 1973). Another Late Archaic phase identified by Ritchie (1980) is Brewerton, a local variant of the Laurentian tradition. Although Brewerton-type, notched points have been found throughout the state, the phase is known primarily from the Oberlander No. 1 and Robinson sites, which straddle the Oneida River at the foot of Oneida Lake and represent recurrently occupied central base camps used primarily during the spring and summer. Brewerton sites are said to be most closely associated with swamps and watercourses (Ritchie 1940; Ritchie and Funk 1973).

Late in the Archaic Period (ca. 1500-1000 BC), a burial/ceremonial complex developed and ceramics were introduced. The shift to pottery appears to have been preceded by the adoption of steatite or soapstone pots which made cooking and food preparation easier. These centuries served as a Transitional period between the Archaic and Woodland periods (Ritchie and Funk 1973:87; Funk 1993:198).

Woodland Period (1000 BC–AD 1500). The definitive characteristic of the Woodland period in New York State is the adoption of pottery technology, a development that occurred at different times from one location to another (Snow 1980). Native groups also became more dependent on domesticated plants—including maize, beans, and squash—during the Woodland in the Northeast, although this change does not seem to have significantly altered subsistence and settlement patterns until the Late Woodland, after AD 1000 (Ritchie and Funk 1973:96). In the meantime, hunting and gathering continued to be important elements of Native lifeways for much of the Woodland, and people likely still employed these strategies, at least part time, at the time of contact with Europeans. The Woodland period in New York witnessed significant cultural developments, most of which were related to the adoption of agriculture. Among these were: increasingly sedentary village life accompanied by increases in populations and population densities; technological changes, including the refinement of pottery-manufacturing techniques and the adoption of small triangular projectile points; and an intensification of warfare. These changes occurred alongside—and were probably profoundly influenced by—fluctuations in the degree to which people in the Northeast participated in regional networks of interaction, such as Adena and Hopewell.

In Ritchie's culture-historical framework, the Early Woodland in central New York State is defined as the time during which people manufactured Vinette I-type ceramic vessels, gorgets, tubular smoking pipes,

bar amulets, boatstones, birdstones, and copper ornaments (Ritchie 1980:194; Ritchie and Funk 1973:96). Located on the north shore of the Oneida River at Brewerton, Vinette 1 pottery, the first ceramics in New York, was recovered at this site. The pottery is thick, medium to coarse grit-tempered, and cord-marked. Pipes composed of a similar material were found at the nearby Oberlander No. 2 site (Ritchie 1980:190, 194). During this time, people throughout the Northeast and Midwest interred the deceased with elaborate burial goods (Tuck 1978:39-43). Those in Central New York cremated the dead and buried them with items that included Meadowood projectile points and unnotched cache blades, copper objects, and birdstones. Also, many burials included red ocher. People almost never placed ceramic vessels in Early Woodland graves. Ritchie divides the Early Woodland in central New York into two temporal phases: Meadowood and Middlesex.

During the early part of the Middle Woodland period (ca. AD 1–300) people in central and western New York State participated in the Hopewell Interaction Sphere, a trade network that extended through large areas of the eastern woodlands and was centered in Illinois and southern Ohio. Archaeologically, this network is manifest as geometric earthworks and elaborate burials that have similar qualities across a large geographic area. The burials are usually interred in mounds, in which the deceased were interred alongside objects usually composed of exotic materials including shells from the Gulf of Mexico, Wyoming obsidian, and copper from the upper Great Lakes (Coe et al. 2000:48-55). Although no Hopewell earthworks have been identified in the Northeast, several burial mounds have been located in Central and Western New York State, including those at Lewiston, Cain, Squawkie Hill, Killbuck, Rector, and Vandalia (Ritchie 1938; Ritchie and Funk 1973:118).

The period began when people diversified the techniques they employed to decorate ceramic vessels. While Vinette I vessels were typically plain, people employed a variety of techniques to decorate their wares in the Middle Woodland, including impressions created with a corded stick, rocker-stamping, dentate-stamping, and pseudo-scallop shell stamping (Ritchie and Funk 1973:117; Ritchie and MacNeish 1949). The end of the period, which Ritchie argued came around AD 1000, occurred when people in central New York adopted the suite of characteristics he associated with the Late Woodland: primarily agriculture based on maize, beans, and squash; Owasco-style pottery (collarless vessels with elongate bodies, conoidal bases, slightly everted rims, and cord-wrapped stick-impressed exterior decoration confined largely to their necks); and house structures resembling historical Haudenosaunee longhouses. The direct dating of maize using the Accelerator Mass Spectrometry (AMS) technique, for example, has demonstrated that people in southern Ontario and central New York were growing the crop before AD 700 (Crawford et al. 1997:114-115; Hart et al. 2003:634). Meanwhile, Hart et al. (2003:624-625) and Schulenberg (2002:160-164) have obtained AMS dates from charred residue on the interiors of Owasco vessels that indicate people were manufacturing those pots as early as the seventh century AD (see also Hart and Brumbach 2003:743-744). Beyond this, Hart has demonstrated that people did not construct longhouses in central New York before the beginning of the thirteenth century AD and that they did not likely grow beans until an even later date (Hart 1999, 2000).

The Late Woodland, in Ritchie's scheme for the Northeast, was the period between AD 1000 and the time at which Native people traded for or otherwise obtained European goods, the precise timing of which varied throughout the region. In the 1930s, Ritchie (1937) proposed dividing the Late Woodland into two shorter periods: the Owasco and Iroquois. At the time, he believed Iroquoian groups migrated to the New York State area and replaced the Algonquian Owasco people already living there (see Tuck 1971:11-14). Although, since the 1950s, researchers have generally accepted that Iroquoian speakers did not immigrate to the Northeast at the beginning of the Late Woodland, the distinction between Owasco and Iroquois periods has remained. Also, with the development of radiocarbon dating, the two have acquired distinct temporal boundaries, with the Owasco lasting from AD 1000 to 1300, and the Iroquois spanning the years thereafter (Hart and Brumbach 2003:747). In terms of material culture, the primary differences between the two entities are related to ceramic vessel form and decoration. While Owasco series pots tend to be collarless, decorated with a cord-wrapped paddle or stick, and have elongate bodies surmounting conoidal and subconoidal bases, Iroquois vessels generally have collars, are decorated with incised designs, and have globular bodies (MacNeish 1952; Ritchie and MacNeish 1949).

Although, as outlined above, some of the cultural developments Ritchie associated with the Late Woodland did not occur between AD 1000 and 1100, some—particularly those related to the development of an agricultural system based on maize, beans, and squash—did happen in the succeeding years. In fact, several developments appear to cluster around AD 1200 to 1300: the earliest evidence for longhouses and multiple-household villages is from the thirteenth century AD and people added beans to their diets around AD 1300 (Hart and Brumbach 2003: 744-746). In addition, Snow (1994:30) notes that groups in central New York began surrounding their settlements with defensive palisades after AD 1200. During the later years of the Iroquois period, people in some areas began clustering their villages within the territories occupied by historically known nations (Snow 1994:46-51). During this time, the techniques employed by people to decorate pottery diversified across space, probably reflecting concomitant changes in the ways and frequencies with which people interacted (MacNeish 1952; Whallon 1968). Likely in part because of the large amounts of wood consumed during the construction and maintenance of these settlements, as well as that needed for firewood, inhabitants periodically relocated their villages roughly every 10 to 20 years (Engelbrecht 2003:101-103). In several cases, researchers have reconstructed parts of the resulting sequences of settlements and produced detailed data concerning local culture change and the effects thereon of contact with Europeans (e.g., White 1961).

Contact Period (AD 1500–1650). During the late prehistoric and Contact periods, tribal clusters of Iroquoian-speaking peoples were distributed throughout New York State and lower Ontario. Comprising several thousand people in at least one, and usually several, villages in proximity to one another, each tribal cluster was separated from the others by extensive and widespread hunting and fishing areas (Trigger 1978:344; Engelbrecht 2003). Native American groups in central New York were profoundly affected by the introduction of the fur trade, long before the arrival of a permanent European-American population in the area. This period dates the beginning of the end of traditional native cultural patterns due to ever-increasing political, military, religious and economic interactions with Europeans.

Cultural changes during the late prehistoric period laid the groundwork for the development of the individual nations of the Haudenosaunee Confederacy during the historic period. Archaeologists generally agree that the historic Haudenosaunee nations were preceded in their home territories by Haudenosaunee ancestors during the late prehistoric era. This interpretation is based partly on settlement patterns. In both prehistoric and historic times, Haudenosaunee nations moved their villages at intervals that may have been related to the exhaustion of local resources, such as soil, wood or game. Sequences of village movement spanning the prehistoric, protohistoric/Contact, and historic periods have been inferred for each of the individual Haudenosaunee nations, for example the Seneca (Wray and Schoff 1953; Wray et al. 1987); Seneca and Cayuga (Niemeczyki 1984); and the Oneida (Pratt 1976). The Oneida generally occupied the area encompassing the area around Oneida Creek and Oneida Lake, west of the project area, with control of Wood Creek and the Upper Mohawk Valley (Parker 1922; Campisi 1978:481).

Pratt (1976) identified a cluster of Oneida sites in the hills southwest of the great eastern bend in the Mohawk River at locations on defensible elevations near small streams. The cluster of sites represents a sequence extending from about the fourteenth or fifteenth century into the historic period. However, no antecedent Owasco or Oak Hill phase sites were identified as part of the sequence. (Oak Hill is traditionally considered the transitional phase between Owasco and Iroquois) (Curtin 1995).

It has been proposed that the Oneida sequence was established by individuals who had split off from an ancestral population in the Mohawk valley, the remnants of which later formed the Mohawk nation (Snow 1994). However, alternative locations of Oneida origin may include the upper Mohawk valley (although no Owasco or Iroquoian sites have been located in this area), the Chenango basin to the south, and the western end of Oneida Lake. Owasco sites have been identified in the latter two locations, although Bradley (1987) has classified the sites at the western end of Oneida Lake as components of the Onondaga nation (Curtin 1995).

Beginning with the palisaded Nichols Pond site, the earliest identified site, the sequence reputedly documents the relocation of a pair of villages through a process of merger and decoupling (Pratt 1976). By the historic period, however, the Oneida communities had joined again as one principal Oneida village when visited by Harmen Meyndertsz van den Bogaert in the winter of 1634-1635. Based on historical

records, the Oneida resided in a single village throughout the seventeenth century (Campisi 1978; Pratt 1976; Gehring and Starna 1988; Curtin 1995).

2.2.2 Historic Period. The French explored the St. Lawrence River valley and the Great Lakes region beginning in the sixteenth century, and the Dutch made in-roads in the Hudson and Delaware river valleys in the seventeenth century. European activities in what is now central New York State were limited for almost all of the seventeenth and eighteenth centuries. As noted, the first European to visit the Oneida was Harmen Meyndertsz van den Bogaert in 1634 from Dutch Fort Orange. Reputed to be near what is now Munnsville, in Madison County, southwest of the project area, the village was palisaded and had 66 longhouses, indicating a multiple-family household pattern (Pratt 1976:37, 134; Gehring and Starna 1988; Campisi 1978:481). Later, Jesuit missionary Jacques Bruyas established the mission of St. François Xavier among the Oneida in 1667. While the sowing of Christianity among the Haudenosaunee by the Jesuits generally bore little fruit, the missions had modest effects on reducing the hostility between the Haudenosaunee and the French. The Haudendosaunee and the French would not achieve peace until after 1700 (Abler and Tooker 1978:505-506; Campisi 1978:481-482).

With their seizure of New Netherlands from the Dutch in 1664, the English became the patrons of the Haudenosaunee. For the English, as it had been earlier for the French, the fur trade became an essential imperial concern, and subsequent competition with the French around the Great Lakes resulted in the erection of fortified trading posts within the frontier. Moreover, the imperial rivalry between the English and the French over the fur trade affected their Native American clients, who were forced to ally themselves with one or the other kingdom. While attempting to play one European power against the other, Native nations continued to be drawn into the incessant conflicts that marked the Europeans' struggle for colonial empire (Abler and Tooker 1978).

As the frontier moved west during the eighteenth century, many military engagements between the French and British—and their Native American allies—would be centered on control of the Oneida or Great Carrying Place (in the area that is now the City of Rome). This area was where Mohawk River and Wood Creek flowed near enough to one another that a canoe or bateau could be carried overland from one stream to the other. The key was that the Mohawk River flows easterly into the Hudson River, and Wood Creek, just a mile and a half away, flows westerly into Oneida Lake, and ultimately, through the Oneida and Oswego Rivers, into Lake Ontario. Therefore, the Great Carrying Place (or, in short, the Carry) formed part of a natural channel of navigation linking the Great Lakes and areas inland to the Hudson River and the coastal lands of the Atlantic Ocean. Whoever controlled the flat, marshy land between them could dominate trade and threaten the existence of the Haudenosaunee Confederacy (Larkin 1977:31; Ellis 1977:37; Canfield and Clark 1909:35; Wager 1896:3).

The first land grant in Oneida County, the Oriskany (Ochriskene) Patent, was granted in 1705 to a consortium headed by Thomas Wenham. It comprised land that straddled both sides of the Mohawk River for two miles from Wood Creek to east of "Ochriskene" Creek, and both sides of Oriskany Creek, encompassing more than 30,000 acres (Figure 5). The area is just west of the project area. The patent specified an enormously high quitrent (for its location) of ten shillings, which restricted settlement for more than 80 years, and curiously did not require the patentees to improve or settle the land as almost all other patents required. This land grant included the economically important Oneida Carry as well as navigable portions of the Mohawk River and Wood Creek (Cookenham 1977:45-46; Wager 1896:95-101; Higgins 1976 [1931]:84). In 1756, the Lords of Trade in London recommended to New York Governor Sir Charles Hardy "that he present the facts to the Council and Assembly with a view to securing a law vacating such patents as the ... Oriskany because their fraudulent grants were one of the principal causes of the decline of the English interests with the Indians. Governor Hardy did not attempt to obtain this legislation" (Higgins 1976 [1931]:84). About this time the Oneida village of Oriska was situated near the confluence of Oriskany Creek and the Mohawk River. The word "oriska" derived from the Oneida word meaning "place or stream of nettles" (Lord 1993).

Figure 5. Land comprising “Cosby’s Manor” and the “Oriscany” Patent as shown on the 1779 map of the Province of New York. The approximate location of the project area is indicated by red circle (Sauthier 1779).

The current project area is located in what was the west central portion of Cosby’s Manor, south of the Mohawk River (see Figure 5). William Cosby was Royal Governor of New York and New Jersey from 1732 to 1736. In 1725 a group of Germans with permission from New York Governor William Burnett acquired two parcels of land on both sides of the Mohawk River west of Little Falls from the Haudenosaunee, with which they did nothing for nearly ten years. In 1734 the title to the western parcel was patented to Joseph Worrall and ten associates and the title to the eastern parcel was patented to John Lyne and eight associates. Nine of the patentees in each patent were the same. Both parcels were conveyed to Governor Cosby six days later, and the combined tract is referred to as Cosby’s Manor, although Cosby never lived there. Cosby died in 1736 leaving the land to his two sons and his widow. The sons died intestate and Cosby’s widow, Grace Cosby, sold the lands north of the Mohawk River (approximately 21,000 acres) to Oliver De Lancy, Goldsboro Banyar, James Jauncey, and Peter Remsen between 1761 and 1767. However, a problem was discovered with the quitrents as well as the actual size of the parcel which scuttled the deal. A portion of the tract in present-day Oneida County was purchased by a group of investors led by Philip Schuyler at sheriff’s sale in July 1772. Schuyler acquired approximately 8,000 of the tract’s acreage. Still retaining the designation as Cosby’s Manor, the tract was surveyed by John Bleeker in 1786 (Bagg 1892:20-21; Wager 1896:98-103; Curtin et al. 1999:15-16).

While Dutch, French, and English traders and missionaries were the first visitors to the Mohawk Valley, the first permanent European settlers of the area were German refugees, largely from Lower Palatinat (present-day southwestern Germany near Luxembourg). More than 3,000 Palatine refugees left England for the Province of New York in January 1710; more than 700 died on the journey over or while in quarantine on Nutten [later Governor’s] Island. They were initially settled in the mid-Hudson Valley (north of present-day Kingston) to work, serf-like, for the English government in order to “raise hemp for cordage, and to manufacture tar and pitch, so that the government would no longer be obliged to buy these much-needed commodities for ship-building from other countries” (Cronau 2000; see Benton 2001 [1856]). Robert Hunter had devised a scheme to supply necessary products to the British Navy and petitioned the Board of Trade to provide a labor force for his project. As a result, Palatine refugees, who

had flocked to London to escape dire economic conditions in their homeland (in general, the Lower Palatinate and neighboring states) would be resettled in the colonies to provide labor under Hunter's "Naval Stores" project, among other locales in the British New World (Witthoff 1999; Otterness 2004:72-74). In 1710, while Hunter was appointed Governor of New York, the Palatines were resettled on lands purchased from Robert Livingston of Livingston Manor (in exchange for the contract to provision the immigrants) as well as on tracts on the west shore of the Hudson River in what is now Ulster County (Witthoff 1999). For a variety of reasons, the project was a total failure and the Palatines were left to fend for themselves. Nearing starvation, 50 families relocated to the Schoharie Creek area, with the consent of the Indians in October 1712 (Witthoff 1999; Otterness 2004).

As a result, the limits of European homesteading crept further into Oneida and Haudenosaunee territory during the first half of the eighteenth century. From the first furrows of German settlement near Schoharie Creek, additional Palatine settlements took root farther west along the Mohawk River. In 1723, the first permanent European settlement in what would become known as the Town of German Flatts was established as part of the Palatine German community within the so-called Burnetsfield Patent of 1725 (Benton 2001 [1856]; Otterness 2004). Governor Burnet had secured the land from the Mohawks for settlement as well as to establish a buffer between French traders in Canada and English settlements along the Hudson and lower Mohawk. Palatine settlement at what is now Herkimer (also referred to as Burnetsfield) was the westernmost European-American settlement along the Mohawk River in the 1730s (Otterness 2004:142-145).

In 1722, the British built a trading post at Oswego (becoming Fort Oswego by 1727), and carried on considerable trade between Oswego and Albany through Oneida territory until the American Revolution, making it the most important British outpost west of the Hudson. As a result, securing the Carrying Place (or *Deo-wain-sta*, the place where a canoe is carried between two streams, as the Oneida called it) became a matter of great importance, and military outposts were subsequently erected to protect the route. Fort Williams (near Rome) would be established in 1746 and Fort Bull on Wood Creek at the Carry in 1755 (Lord 1993). Other British forts were constructed or begun during the hostilities with the French in the 1750s at or around the Oneida Carrying Place, as well as along the Mohawk River to the east. Fort Schuyler was established at what would become Utica in 1758 (see Figure 5).

During the French and Indian War, Native Americans allied with France conducted raids in the Mohawk Valley, with the Palatine settlements at the edge of the frontier bearing the brunt of the carnage. The area around Fort Herkimer was attacked twice. In November 1757, the settlers took refuge in the fort as the French and their allies attacked the settlement on the north side of the river: approximately 30 houses were abandoned, and gristmills and sawmills were burned. A second attack occurred the following spring, this time on the south side of the river. Many of the settlers again took refuge inside the fort, and those who did not reach the fort were either killed or scalped (Herkimer County Historical Society 1992:35). During the war, two separate movements of British forces, the first under the command of Lt. Colonel James Bradstreet (which captured Fort Frontenac on the north side of Lake Ontario in 1758) and the second under Brigadier General John Prideaux (which captured Fort Niagara in 1759), used the Mohawk River-Wood Creek route to reach the staging area for their advance to the site of their engagements with the French.

The initial settlement at what is now Utica was a military work built in 1758 at a fording place in the Mohawk River, which was constructed there during the French and Indian war. Designated Fort Schuyler (later referred to as "Old Fort Schuyler"), it was an earth embankment surrounded with palisades on the south bank of the river in what is now the eastern part of the city (Wager 1896:278; Bagg 1892:17). It was named for Colonel Peter Schuyler. Also constructed in 1758, Fort Stanwix was erected at the Carrying Place in what is now Rome. This fort marked the western boundary of legal British settlement from 1768 to 1783. With the French threat extinguished at the end of the French and Indian War, Fort Schuyler, like other frontier fortifications, fell into disrepair and was largely abandoned by 1768. With the return of peace, the migration of homesteaders into frontier and Haudenosaunee territory recommenced. This aggravated relations with the Native nations already living and hunting there. While no permanent settlements had been established in the lands south or west of German Flatts, the erection of forts and trading posts had caused uneasiness among the Haudenosaunee (Tooker 1978:434).

At Fort Stanwix, the Haudenosaunee signed the "Property Line Treaty of 1768" which ceded to the British all lands east of the Allegheny Mountains (including territory not actually under Haudenosaunee control), excepting reservations of Mohawks and others, for the purposes of settlement. The eastern half of Oneida County, including the project area, is east of the 1768 Property Line and its control was ceded to the British under the provisions of the treaty (Tooker 1978:434-435). Settlement was deterred by the growing animosity between the British and the colonists along the Atlantic coast. This hostility renewed the strategic importance of the area surrounding the Oneida Carrying Place and the Mohawk Valley. As a consequence, the colonials fortified the existing posts in the frontier, such as Fort Schuyler, and erected several new fortifications, such as Fort Dayton at what is now the Village of Herkimer in 1776 (Benton 2001 [1856]).

During the American Revolution, both the British and Americans enlisted the aid of individual Haudenosaunee nations in their battles in the frontier. Although the Confederacy itself maintained an official policy of neutrality, several of the nations (i.e., Mohawk, Onondaga, Cayuga, Seneca) allied with Great Britain and several (i.e., Oneida, Tuscarora) with the Americans. As part of their strategy to cripple the frontier economy by disrupting agricultural activities, the British enlisted their Haudenosaunee allies to participate in raids on isolated farming communities. Further, British Major General John Burgoyne saw control of the Mohawk Valley as an important element in his strategy to split New England from the rest of the rebelling colonies and snuff out the revolutionary fire. Part of his plan involved the advance of forces under the command of Lt. Colonel Barry St. Leger from Oswego through the Carry, destroying Fort Stanwix and the American defenses in the process, then down the Mohawk to join Burgoyne near Albany. Burgoyne was to make a clean sweep of everything from Lake Champlain south. The third component of the plan called for Sir Henry Clinton to advance north through the Hudson Valley with his forces from New York City. The confluence of these forces never materialized (Ellis 1977:38).

Leaving Oswego on July 26, 1777, St. Leger's force of British Regulars, Hessian infantrymen, artillerymen, Tory Rangers, and as many as 1,000 Indians (led by Mohawk Chief Joseph Brant [Thayendanega]) besieged the refurbished Fort Stanwix (renamed Fort Schuyler after its refortification by the Patriots and, as a result the former fortification called Fort Schuyler at what is now Utica was referred to as "Old Fort Schuyler") beginning on August 2. Brigadier General Nicholas Herkimer commanding the Tryon County militia set off from Fort Dayton to relieve the siege. They were joined by approximately 60 Oneida at the Oneida village of Oriska near the confluence of Oriskany Creek and the Mohawk River (Keesler 2004; Gould 2000; Ellis 1977:38-39).

However, before Herkimer's troops reached Fort Stanwix, they were ambushed by a detachment of Rangers, local Tories, and allied Native Americans beginning on the morning of August 6. The spot of the ambush was dense forest on high, undulating ground west of the marshy Oriska Creek. The intensely fought Battle of Oriskany raged for approximately six hours including an approximately one-hour break when the field was engulfed by a downpour. No one really knows how many were killed in the battle. One estimate has the Patriot militia losing between 450 to 500 men, excluding prisoners. The Americans retreated with their wounded to Old Fort Schuyler. General Herkimer was one of the casualties. Although he survived the battle, Herkimer bled to death at home eleven days later after a surgeon botched the amputation of his wounded leg. The British lost an estimated 200 men, not including the more than 100 Native Americans who were killed. The actual number was never tabulated. The militia never reached the fort (Ellis 1977:39-41; Gould 2000).

During the battle, Colonel (later Major General) Peter Gansevoort heard the gunfire and dispatched a sortie under the direction of Colonel Marinus Willett to help Herkimer. This detachment raided and destroyed a nearby camp of Native Americans and Tories, which lured them away from the main battle. Without their allies, the British withdrew, leaving the Patriots with the bloody field. After the engagement, the Patriots retrieved the wounded and returned to their Mohawk Valley farms, leaving the dead on the field (Ellis 1977; Gould 2000; Keesler 2004). The siege of Fort Stanwix continued for an additional 16 days until St. Leger received word that Major General Benedict Arnold was marching up the Mohawk Valley with a large force. St. Leger retreated back to Canada on August 22, ending the siege (Ellis 1977:42-44; Gould 2000).

In the aftermath of the Battle of Oriskany, Britain's Haudenosaunee allies in retaliation destroyed the Oneida villages of Oriska and Oneida Castle and their nearby fields and killing many of their occupants (Keesler 2004; Campisi 1978:483). The battle should be considered a Patriot victory, despite the failure of the militia to reach Fort Stanwix and relieve the siege, since the engagement ultimately prevented St. Leger from reaching Albany to assist Burgoyne at the Battle of Saratoga, one of the most important Patriot victories during the Revolution (Cookinham 1912:27-39; Keesler 2004). After Oriskany fighting on the frontier consisted largely of terrorist raids by the British and their allies on non-military settlements in the Mohawk, Unadilla, and Cherry valleys. Col. Willet and his militia, headquartered at Fort Plain, fought a guerilla-style war with Loyalist forces in the area. Several skirmishes also occurred in the Mohawk Valley, including the Battle of Klock's Field (1780), Johnstown (1781), and the Tory raid of Currytown (1781). American forces evacuated to areas east, and all European-American settlements prior to 1784 were destroyed and the area was reputed to have returned to wilderness. Since the Patriots had renamed Fort Stanwix Fort Schuyler, the fort formerly called Fort Schuyler was referred to as Old Fort Schuyler. After the close of the war, frontier fortifications such as Fort Schuyler and Fort Stanwix fell into ruin by the late 1780s. (Durant 1878:369; Wager 1896: 512; Cookinham 1912:39).

During the Revolution most of the individual Haudenosaunee nations had sided with the British, while the Oneida and many of the Tuscarora sided with the Patriots, as a result of the influence of Samuel Kirkland. After the war, "[t]he Americans and the Six Nations signed a treaty at Fort Schuyler [formerly Fort Stanwix] in 1784. By its terms all of the Iroquois tribes, except the Oneida and Tuscarora, lost most of their lands. Because of their service to the Americans, the Oneida and Tuscarora retained ownership of all their land" (Lenig 1977:29-30). Further, New York State prohibited the purchase of Indian land by individuals and voided all such purchases made without legislative approval after 1775. These gestures, however, did little to protect the Oneida, who sold present-day Broome and Chenango counties to the state for \$15,500 in 1785. In a treaty signed between the Oneida and the State of New York in 1788 at Fort Schuyler (formerly called Fort Stanwix), the Oneida ceded to the state all their land east of Oneida Lake, except for the Oneida reservation (which was formally established as a result of this treaty). Initially comprising about 300,000 acres in what are now Oneida and Madison counties, the reservation was affirmed by the 1794 Treaty of Canandaigua. By the end of the 1830s, most Oneida had relocated to Wisconsin, leaving approximately 157 Oneida on their ancient territory as of 1845 (Durant 1878; Lenig 1977:30; Campisi 1978:484-485).

Early Settlement and Statehood Period. Although the first grant of land in the territory that would become Oneida County occurred with the Oriskany Patent in 1705, homesteading did not begin in earnest in the area until 1784 and the second Treaty of Fort Stanwix. The earliest settlement in what is now Utica occurred in 1773 at Deerfield Corners by Mark Damuth, Christian Reall, and George J. Weaver and their families. However, they fled their homes with during the British depredations a few years later. Settlement did not return until 1784. One of the Damuths settled at the old Fort Schuyler section of Utica in 1785 (Jones 1851:141-142; Greene 1924).

About the same time, in 1784, Revolutionary-war veteran Hugh White arrived from Connecticut to settle what became Whitestown. By 1787, European-American settlement west of what is now the City of Utica consisted of three log houses at Old Fort Schuyler (Utica), seven at Whitestown, three at Oriskany, five at Fort Stanwix, and three at Westmoreland (Webster 1977:219; Canfield and Clark 1909:87; Jones 1851:371). Shortly after the restoration of peace, the owners of the Oriskany Patent who had not sided with the British during the Revolution began the process of subdividing and developing their tract. (Those patentees who had sided with the British had their lands confiscated.)

Cosby's Manor was surveyed by John R. Bleeker in 1786. The subsequent map depicted three houses near the ford, and some improvements both a little farther east near the present city limits and a little farther westward; "otherwise the region was covered with an unbroken forest" (Wager 1896:278-279). These houses were identified as occupied by John Cunningham, Jacob Christian, and George Damuth. In 1787 settlement at what is now Utica consisted of "three log huts or shanties, near the old Fort" (Child 1869). Settlers of Utica before 1800 included Uriah Alverson, Philip Morey and his sons, Sylvanus, Richard, and Solomon, Francis Foster, Stephen Potter, Joseph Ballou, Jason Parker, John Cunningham, Jacob Crestman, Peter Smith, John House, Matthew Hubbell. Businesses established themselves near

the river, since that was the primary means of travel and much of the surrounding area was swampy. John Post was the first merchant trading with the Indians as well as sources in Schenectady ca. 1790, a primary product was said to be ginseng (Child 1869). He also kept the first tavern in the town. Ca. 1794, Moses Bagg, a blacksmith, operated an early tavern in the eastern portion of the town.

Efforts soon began to improve the regional transportation systems to facilitate the movement of goods and people into and from the area. During the 1790s, river improvements, the erection of a bridge over the Mohawk River at Old Fort Schuyler, and funding for the extension of the Genesee Road through Old Fort Schuyler to Geneva (later referred to as the Seneca Turnpike) provided an economic jolt to the community (Child 1869; Bagg 1892:17-18). The importance of removing the obstacles in the Mohawk River to better inland navigation was recognized immediately. In 1792, the Western Inland Lock Navigation Company (WILNC) was incorporated by the New York Legislature to improve the route between Schenectady and the Oneida Carry near Fort Stanwix. "The directors of the company appointed a committee consisting of General Schuyler, Elkanah Watson and Goldsboro Banyar to examine the state of the Mohawk River to Fort Stanwix and across the portage to Wood Creek" (Wager 1896:216). WILNC constructed several canals along the Mohawk River beginning in 1797 (Shaw 1990; Lord 1993; Larkin 1977:32). By 1800, Utica had 70 buildings and Rome 50.

The Town of Whitestown was created from the Town of German Flats in 1788. Ten years later, in 1798, Oneida County was formed and Old Fort Schuyler was incorporated as the Village of Utica. Utica and Whitestown shared the role of county seat until 1854. At the time of its incorporation, Utica contained 50 houses with more than 200 people. By 1804, the village supported "four tanneries, two nail factories, two breweries, a hat factory, and a cabinet maker, watchmaker, potter, shoemaker, rope maker, besides other shops, stores, taverns, two churches, a school house, barns and other buildings" (Greene 1924). In 1805, Utica was still relatively compact with only Main, Whitesboro, Genesee, Hotel, and Seneca streets in use, although other streets had been planned. "Business found its way from the river as far up Whiteboro as Hotel street, as far up Genesee as the upper line of Broad, and a little way along Main; beyond these limits shops and stores were sparingly intermingled with private residences" (Bagg 1892:84).

As population spread westward and commerce increased along the Mohawk River, land roads proved insufficient to meet the needs of the expanding population. Further, after disappointing results along the western frontier during the War of 1812, a full water route to western New York was put into development. In July 1817 construction of the Erie Canal began at Rome. The route through Oneida County was location in and along the Mohawk River and the low swampy areas around it. The first trip in the canal was completed from Utica to Rome on October 22, 1819 (Bagg 1892:143, 222). The WILNC was liquidated in 1821 and its assets subsumed within the Erie Canal project. The Town of Utica was created from the Town of Whitestown in 1817. Utica was incorporated as a city in February 1832.

The canal connected Buffalo on Lake Erie with New York City on the Atlantic seaboard when it was completed in October 1825. Its route in Oneida County was along the south side of the Mohawk River and ran through what is now the City of Utica. Soon after completion, hamlets and villages sprang up along the route. The success of the canal was almost immediate and the volume of goods and people increased at such a pace that the canal had to be expanded in the 1840s and 1860s (Shaw 1990).

Nineteenth-Century Development. During the nineteenth century, the Erie Canal allowed for the growth of valley villages as the economical means of transportation supported both agricultural and commercial/industrial development. Prior to the opening of the Erie Canal, the Mohawk valley had been the most productive wheat granary in the nation. This changed dramatically when Genesee valley farmers were able to ship their products along the canal to Albany, which, at that time, was the wheat market center of the nation. As the nineteenth century progressed, Mohawk valley farmers concentrated their efforts on dairying and cheese production, which had been practiced to some extent even prior to canal completion. Re-envisioned at the end of the nineteenth century, the Erie Canal was reconstructed as the New York State or Erie Barge Canal between 1903 and 1917 (Wager 1896; McFee 1998).

With the success of the Erie Canal, other areas of the state clamored for a canal to link to the Erie. Authorized in February 1822, the Chenango Canal project connected the Susquehanna River at

Binghamton to the Erie Canal at Utica at the western end of the current project area. Construction of the 97-mile canal began in July 1834 and was completed in October 1836. The importance of the Chenango Canal rested on its utility for bringing Pennsylvania coal north to the growing factories of Utica (Wager 1896:223). Construction of the Chenango canal spurred the development of the surrounding neighborhood. In proximity to the junction of the Erie and Chenango canals, three large factories were built between 1846 and 1848, including the Utica Steam Cotton Mills (on State Street). In addition to factories, dwelling were also erected. The Rome and Utica Plank Road opened in 1848 along the route that is now Whitesboro Street (McFee 1993:180-181).

However, the successes of canal movement encouraged competition from a developing technology—railroads. The construction of the Utica & Schenectady Railroad began in 1834 and the line became operational in September 1836. The Syracuse & Utica Railroad was completed in July 1839. Paralleling the Mohawk River on the south, the line was consolidated into the New York Central in 1853 as was the Utica & Schenectady Railroad. Its passenger service was subsumed by AMTRAK in 1971 and its freight service by Conrail in 1976 (Wager 1896: 225-226; Herkimer County Historical Society 1992:138, 141). This was the primary line in the county until the 1880s. In 1881, construction began on the New York, West Shore & Buffalo Railroad, which ran west from Utica. Declared bankrupt in 1884, the line was leased to the New York Central in 1885. It ceased operations in 1966 (Herkimer County Historical Society 1992:138, 142-144; Larkin 1977:34). Other railroad lines in the city included the Utica, Chenango & Susquehanna Valley Railroad (finished in 1870 and leased to the Delaware, Lackawanna & Western Railroad); the New York, Ontario & Western Railroad; and the Utica, Clinton & Binghamton Railroad (this line was leased to the New York & Oswego Midland Railroad, and later to the Delaware & Hudson Canal Co. in 1875) (Wager 1896:227-228).

Initial settlers to the Utica area comprised a mix of New Englanders, Dutch, German, and Welsh people. Later immigration brought in by the Erie Canal drawn by the need for labor for the construction of the Chenango Canal and the railroads included Irish and German workers, who later worked in Utica's mills, factories, and domestic service. Population of Utica increased from 2,972 in 1820 to 12,782 by 1840, and to 23,686 in 1865 (Child 1869).

During the nineteenth century Utica was a manufacturing center in the Mohawk Valley. Near both reliable transportation routes and fertile agricultural fields, Utica became a convenient location for the creation and distribution of goods and products. Although the lack of water power was initially a hindrance to larger-scale manufacturing, this was overcome by the completion of the Chenango Canal, which brought Pennsylvania coal to feed the steam-power needs of the city (Wager 1896:366). Early manufacturing operations included Ephraim Hart's foundry, which began in 1822 (it became Hart and Crouse by 1896); several grist mills along the Mohawk River in the 1820s; two antecedents of Central New York Pottery; and the Vulcan Works (founded in 1832 and became the Utica Steam Engine and Boiler Works in 1896). In addition, the Munson Brothers foundry, machine shops, and mill machinery factory was established in 1823 by Alfred Munson. The firm later became Hart and Munson, then Munson Bros. in 1868 (Wager 1896:367). A planing mill was established by Philo Curtis, which was making sashes, doors, and blinds by steam power by 1834. The firm passed through several hands and was called Charles C. Kellogg & Sons by 1896. Metcalf & Dering and Edward F. Downer & Sons were other lumber mills at the end of the nineteenth century.

Utica was a center for textile manufacturing, including oil cloth, beginning in 1832. Some notable nineteenth-century companies included James B. Martin; William Taylor & Co.; Rockwell, Rhodes, & Miller; Roberts, Butler & Co.; Owen, Pixley & Co., later H. D. Pixley & Son and Owens Bros.; Crouse & Brandegees; Utica Clothing Co.; Utica Steam Woolen Mills (1846), and Utica Steam Cotton Mill (1847). Successful firms also included the Globe Woolen Mills was established as the Utica Globe Mill Co. in 1847 and employed approximately 1,000 workers at its height. Most mills were located in West Utica in the neighborhood of the Chenango and Erie canals, which attracted numerous German and Irish immigrants to work and live. New textile mills opened during and after the Civil War, including Utica Steam Knitting Mill (1863) Oneita Knitting Mill (1878), Mohawk Valley Cotton Mill (1880), the Skenandoa Cotton Company (1881), and Utica Knitting Company (1890), among others. Some of these were opened

in the east side of the city. More than 11,000 workers were employed in Utica's textile mills at the end of the nineteenth century (Wager 1896:368-369; Pristera 2009:8, 10).

Iron makers, forges, and foundries were also quite successful and included Phoenix Iron Works (founded in 1852); Russel Wheeler & Son (1842), The Carton Furnace Company (1847), Irvin A. Williams & Co. (1851, maker of locomotive head lights); Utica Stream Gauge Company (1861); and Utica Pipe Foundry Company (1889). Other prominent companies included Utica Knitting Company (1863, reorganized 1891); Wild & Devereux (1874); the Mohawk Valley Cap Factory Company (1868); Empire Scotch Cap Factory (1887); Utica Burial Case Company (1890), as well as a numerous shoe manufacturers and breweries (Wager 1896:370).

Figure 6. Approximate location of the project area in 1874 (Beers et al. 1874).

The necessities of the Civil War ushered in a new era of industrialization, one geared toward greater concentration of manufacturing and heavy industry in northern industrial centers, facilitated by rail transportation. By 1869, the City of Utica was a nexus of numerous transportation routes. The Genesee turnpike, the Erie Canal, and the New York Central extended through it. It served as the northern terminus of the Utica, Chenango, & Susquehanna Valley and the Utica, Clinton & Binghamton railroad as well as the Chenango Canal. It was the southern terminus of the Utica & Black River Railroad. The city was serviced by several horse railroads as well as stages. In addition, it supported 30 churches, 11 banks, numerous manufacturing operations, producing textiles, steam engines, musical instruments, telegraphic materials, and other items (Child 1869). The notable companies at that time included, the Globe Woolen Mills, the Utica Burr Mill Stone Manufactory (Hart & Munson), the Wood & Mann Steam Engine Company, and the Utica Steam Gauge Company, in addition to some of textile mills noted above (Child 1869). The New York State Lunatic Asylum (Utica State Hospital; opened 1843, closed 1978; designated a National Historic Landmark in 1989) was west of the project area (Larkin 1977:35; Beers 1874). The abundance of rail options as well as the more regular service resulted in the replacement of the Chenango Canal for shipping coal and freight. The Chenango Canal, west of the project area, closed in 1878. Rail transport and industrial jobs encouraged the arrival of numerous Italian and Polish immigrants after about 1870 (Canfield and Clark 1909; Wager 1896; Sanborn 1888).

The economic situation of the communities encircling the City of Utica changed in the wake of growing industrialization and urbanization. Mercantile business formerly conducted in rural settlements outside the city was diverted to the city. As Wager noted, "one of the causes of this exodus from the country [to the city] is the changed condition of agricultural interests which have been brought about since the [Civil War], largely through the competition of the products with the great West, and partly through the general

depreciation of rural real estate values” (Wager 1896:199-200). Land devoted to farming decreased, while the productivity of that land rose, especially in the twentieth century. Between 1875 and 1969 the acreage being farmed decreased from 704,363 acres to 319,806 acres. Cattle raising and dairying became more profitable and began to replace grain production, with over 500,000 acres devoted to livestock in 1879. By 1900, Oneida County was rated first in the annual production of cheese and dairy products (Crisafulli 1977a).

Equally important to the shift in farm production was the trend toward more owner-farmers and less tenant farmers. Almost 75 percent of the farms in Oneida County were owner-operated by World War I. Moreover, improvements in mechanization and the introduction of new and larger farm machinery enabled farmers to consolidate and expand their acreage. As a result, marginal farmers were forced out of business and the number of farms declined, but the remaining farms more than doubled in size. Therefore, as the economy of the City of Utica became more industrial and commercially oriented, the countryside surrounding it became more rural as farms increased acreage and were owner-operated (Wager 1896:200, 532; Crisafulli 1977a:50-52, 1977b:103-106).

As a result of the increasing supply of workers, factories in Utica flourished between ca. 1890 and 1950. Textile mills and knitting factories were especially robust. Industry expansion included the emergence of Oneida Mills, Frisbie-Stansfield Knitting Company, and Utica Knitting Company as national leaders in the knit goods industry. Other large companies included the Mohawk Valley Cotton Mill which merged with the Utica Steam Cotton Company in 1901. The height of the Utica textile industry was 1910 when nearly two-thirds of the city’s inhabitants worked in textile-related industries (Kirk et al. 2012; Pristera 2009:12-14).

Transportation changes facilitated the industrial development as establishment of the textile industry emerged with the completion of the Erie and Chenango canal. Beginning in 1886 streets of the city began to be paved with asphalt, beginning with Rutger Street. In 1887, the Utica Electric Light Company began to provide street lighting, “starting in the business section, although lighting for residential districts...soon followed” (Morton 2010). The electric streetcar was introduced in the 1890s and an interurban electric line, Utica & Mohawk Valley, ran between Rome and Little Falls during the early twentieth century. The Utica Belt Line Railroad system ran along Lafayette, Columbia, and State streets (Larkin 1977:35; Beers et al. 1874; Century Map Company 1907).

With the closure of the Chenango canal, the northern end of the former canal was gradually turned into a reservoir for the Erie canal. The abandoned canal channel was ultimately filled, although it was still depicted as open in 1888 (Sanborn 1888, 1925). As noted the canal system was reimagined and modernized during the early twentieth century and the subsequent Barge Canal was completed in 1917 through Utica. Gradually filled, the former Erie Canal channel was leveled through the city by 1923 and became Oriskany Street. The North Genesee Arterial was completed in the 1970s (Morton 2010).

Twentieth Century. The textile industry began a slow decline after World War I as the industry was plagued by over supply and northern textile operations shifted work to mills in the South. While Utica supported more than 40 mills in 1910, only six survived in 1922. Further, transportation improvements like the trolley and later the automobile freed workers from living in proximity to their places of employments. This freedom resulted in workers, especially the better paid, seeking to find living arrangements in less crowded and noisy places and gave rise to suburban housing areas. By 1940 the city had a population of 100,518 (Pristera 2009:15-18).

After the war, General Electric opened a factory in Utica which expanded during the 1950s as the Cold War intensified. This factory helped offset the loss of textile jobs as GE employed more than 5,800 people at the close of the 1950s. During this period large infrastructure projects like the construction of the North-South Arterial (New York State Route [NY] 12), the East-West Arterial (NY 5S), and the Sauquoit Valley Arterial (NY 8) helped speed the development of residential suburbs and draw residents from the central city. In addition, the completion of the New York State Thruway (Interstate-90) north of the city in the mid-1950s helped commerce bypass the area. During the late 1950s and 1960s, urban renewal plans led to the demolition of numerous city buildings, which became vacant lots when proposed projects did not

materialize. In 2006 structures in the area were demolished for a police support facility. A major economic development in the area during the twentieth century was the construction of the U.S. Air Force repair and maintenance depot, which served the entire northeastern section of the nation. This facility would develop into Griffiss Air Force Base, northeast of the City of Rome (Pristera 2009:20-21; Crisafulli 1977a:50-52, 1977b:105-112; Lehman 2016a, 2016b). The base closed in the late 1990s, although Rome Laboratories (now the Air Force Research Laboratory) continued to utilize buildings within the facility, which has become the Griffiss Business and Technology Park. The City of Utica had a population of 62,235 in 2010.

2.3 DOCUMENTARY RESEARCH

2.3.1 Site File and Records Review. A review of archaeological site files on the OPRHP/SHPO CRIS resulted in identifying one archaeological site previously reported within the project's APE, and 48 archaeological sites reported within one mile of it (Table 2). Forty-five (45) of the sites are historic, two are Precontact Native American sites, and one is a multicomponent Precontact/Historic site. Ten historic sites are considered NRHP-eligible; two historic sites were previously determined not NRHP-eligible, and the eligibility of the remaining sites is undetermined.

The archaeological site reported within the APE is a historic site identified as 442 Lafayette Street Historic Site (NYSM 12153; USN A06540.001655). A scatter of historic materials (e.g., ceramics, glass, nails, and bricks) was found at the site. National Register eligibility of the site is undetermined. This site location will most likely require testing to determine its National Register eligibility unless the location can be avoided (i.e., no subsurface disturbance).

All but seven of the historic sites within one mile of the project area are clustered west and southwest of the APE near Route 12. The two previously reported precontact sites are also located west and southwest of the APE and are greater than 750 ft. (229 m) from the property. The precontact sites include 613 Court Street Historic and Precontact Site (06540.001668) and 617 Cooper Street Historic & Precontact Site (NYSM 12158; 06540.001660). Site 06540.001668 is National Register-eligible and Site 06540.001660's National Register-eligibility is undetermined.

Early archaeological surveys by Beauchamp (1900) and Parker (1922) were consulted. Later archaeological investigations by Ritchie (1980) and Ritchie and Funk (1973) do not report the presence of archaeological sites in the project area.

Table 2. Archaeological sites within approximately one mile of the project area.

Unique Site Number (USN)	Additional Site #	Distance to APE ft (m)	Time Period	NRHP Eligibility
06540.000838	Durham Project 62; Utica Landing	3,953 (1,204)	Historic	Undetermined

Previous Surveys. One archaeological investigation (PIN 2134.41.121 New York Routes 5, 8, and 12) was conducted within the APE according to the OPRHP/SHPO CRIS which resulted in the identification of 442 Lafayette Street Historic Site (NYSM 12153; USN A06540.001655) previously discussed. One architectural investigation was conducted (16SR00991: Utica National Register Districts Survey Area: Downtown) which partially overlaps with the east side of the construction APE.

Historic Districts. There seven historic building districts are located within one mile of the APE (Table 3).

Table 3. Historic Districts within approximately one mile of the project area.

OPRHP #	District Name	Distance to APE ft (m)	Time Period	NRHP Eligibility
06540.001910	Mohawk Valley Psychiatric Center Historic District	3,064 (934)	Historic	Undetermined
06540.001883	Globe Woolen Company Mills	1,546 (471)	Historic	Listed
06540.001874	Rutger-Steuben Park Historic District	1,269 (387)	Historic	Listed
06540.001876	Lower Genesee Street Historic District	825 (282)	Historic	Listed
06540.001996	Bagg's Square East Historic District	1,512 (461)	Historic	Undetermined
06540.001988	East Utica Little Italy Historic District	3,927 (1,197)	Historic	Eligible
00104.000641	New York State Barge Canal Historic District	2,693 (821)	Historic	Listed

Register Listings. A review of the New York State and National Registers of Historic Places (NRHP) listings, as recorded in the files of the OPRHP/SHPO, did not identify any properties, buildings, sites or districts as listed or eligible for listing within the construction APE. However there are four NRHP-listed and one NRHP-eligible historic districts located within one mile of the construction APE (see Table 3).

2.3.2 Historical Map Analysis. Eleven historical maps and atlases were consulted for the project area (Rogerson et al. 1852; Beers et al. 1858 [Figure 7], 1874 [see Figure 6]; Roe & Taylor 1868 [Figure 8]; Hopkins 1883 [Figure 9]; Sanborn 1884 [Figures 10], 1888 [Figure 11], 1925 [Figure 13], 1952 [Figure 14], 1986; and Century Map Company 1907 [Figure 12]). As expected for an intensely urban

environment, the lots in the project area contain numerous buildings and structures. A selection of historical maps was used to prepare a list documenting the structures at each current address in the project area and details its development over time. The results of this review are presented in Table 4, which appears after the historical map figures.

Figure 7. Approximate location of the project area in 1858 (*Beer et al. 1858*).

3.0 Field Reconnaissance Results

Field reconnaissance was conducted in March 2018 to assess the severity of soil disturbances that might have destroyed or otherwise adversely affected archaeological sites, if any are previously present. The project's APE consists of several developed city blocks containing structures and parking areas associated with business and residences. Nearly the entirety of the APE is paved or built with a few scattered locations of grass such as the "yard area" adjacent to Dental Systems Group at Columbia Street and State Street, a few small yards near residences, and narrow strips of grass between lots/structures and streets (Figure 15). Buried utilities are undoubtedly common beneath the narrow grassy strips between the streets and sidewalks or paved lots.

An overlay comparison of five Sanborn maps from years including 1884, 1888, 1925, 1952, and 1986 identified only four small locations where structures had not been recorded and thus are presumably the least disturbed. The total approximate surface area of the four locations is 3,826 ft² (1,166 m²). These locations are indicated on Figure 15 and arbitrarily designated A through D:

- **Location A:** This location is within a currently a paved lot associated with Maugeri's Auto Body (402 State Street). Location A includes approximately 772 ft² (235 m²) of area.
- **Location B:** This location is within the grass lawn frontage of Dental Systems Group at 601 State Street (Appendix A: Photograph 31). Location B includes approximately 1,373 ft² (418 m²).
- **Location C:** This is a grass-covered gravel area along the west side of a parking lot associated with J.P. O'Brien Plumbing & Heating (411 Columbia Street) (see Appendix A: Photograph 31). Location C measures approximately 631 ft² (192 m²).
- **Location D:** This location is within a currently paved lot adjacent to the north side of the Salvation Army Thrift Store (400 Columbia Street) (Appendix A: Photograph 32). Location D includes approximately 1,050 ft² (320 m²).

A previously reported historic archaeological site "442 Lafayette Street Historic Site" (NYSM 12153; USN A06540.001655) is within the yard of the extant building. Access was not available during the Phase 1A field reconnaissance but aerial imagery and site form photographs show this to be a small grass yard. A view toward the site from outside the property limits is presented in Appendix A: Photograph 18.

Other observations. Presumably Erie Canal-related stone blocks were observed in a pile near northwest limits of the APE along the State Route Highway 5 overpass, near the approximate location of the confluence of the former Chenango Canal and Erie Canal, facing south (Appendix A: Photograph 33).

Figure 15. Aerial view of the APE with previously unbuilt locations identified in blue.

4.0 Conclusions and Recommendations

4.1 PRECONTACT ARCHAEOLOGICAL SENSITIVITY

The former natural setting of the project area in proximity to the Mohawk River indicates that the APE is sensitive for precontact archaeological sites. Three precontact archaeological sites (or sites with a precontact component) were previously found within one mile of the APE including: 617 Cooper Street Historic & Precontact Site (USN A06540.001660; NYSM 12158); 613 Court Street Historic and Precontact Site (USN A06540.001668; NYSM 12166); and 613 Court Street Historic and Precontact Site (USN A06540.001668; NYSM 12166).

However, years of urban development very likely disturbed or destroyed any precontact sites if any are or were present. The overlay comparison of historic maps identified only four small locations where no structures were ever recorded and thus are presumably the least disturbed (see Figure 15). It is possible that archaeological sites could be covered by fill and pavement but due to the size of the APE, mechanical removal of fill/pavement is not logistically practical. The possibility of finding archaeological sites beneath fill is too low to warrant the level of effort required to conclusively determine their presence or absence. The most practical approach to assess the extent of soil disturbances and archaeological sensitivity would be the review of soil-boring data which recorded the depth of fill and stratigraphy.

Phase 1B shovel testing might be feasible at Locations B and C, however dense gravel fill might be present beneath the grass and preclude excavation. Locations A and D are paved thus preventing standard subsurface investigation.

4.2 HISTORIC ARCHAEOLOGICAL SENSITIVITY

The project area is sensitive for the presence of a variety of historic archaeological resources associated with, but not exclusive to, urban centers. As discussed in Section 2.3, a historic site identified as 442 Lafayette Street Historic Site (NYSM 12153; USN A06540.001655) is within the APE. The site's National Register eligibility is presently undetermined and, therefore, the site will likely require Phase 2 investigation to assess its significance.

Although it's possible that historic structural foundations and other cultural features could be present beneath pavement and/or fill, the likelihood of intact historically significant cultural resources is considered low.

1.0 Introduction

1.1 PROJECT DESCRIPTION

Panamerican Consultants, Inc. (Panamerican) was contracted by O'Brien & Gere Engineers, Inc. (OBG) to conduct a Phase 1A cultural resources investigation for the proposed Mohawk Valley Health System (MVHS) Utica Hospital in the City of Utica, Oneida County, New York. This report includes the findings of a preliminary architectural survey conducted in the approximately 25-acre (55± parcels) Area of Potential Effect (APE).¹ For this study, the APE is the Project location, which is generally bounded to the west by the North-South Arterial Highway Route 12, to the north by Oriskany Street West/State Route 5, to the east by Broadway, and to the south by Columbia Street (Figures 1.1 and 1.2). The Project, if advanced, would result in substantial demolition and new construction within a majority of the APE, as well as the need to eliminate Lafayette Street between State Street and Broadway. Figure 1.3 presents the most current Project Site Plan depicting the proposed hospital facilities.

The purpose of this Phase 1A architectural inventory was to determine if any existing State/National Register of Historic Places-listed or -eligible resources (individual and historic districts) are present within the APE for the project and to provide an inventory of all architectural resources (structures) in the Project APE as per the request of the New York State Office of Parks, Recreation and Historic Preservation (OPRHP). This Phase 1A study included the following: documentary and historical map research; an online search of the New York State Historic Preservation Office's (SHPO) Cultural Resource Information System (CRIS); identification of properties listed or eligible in the New York State and National Registers of Historic Places (S/NRHP) in the APE; and a pedestrian survey of buildings in the project area. The Phase 1A archaeological investigation for the Project presents photographic documentation of the existing conditions characterizing the APE (see Hanley et al. 2018: Appendix A)

The cultural resource investigation was conducted in compliance with the National Historic Preservation Act (as amended), the National Environmental Policy Act, the New York State Historic Preservation Act, and the State Environmental Quality Review Act, as well as all relevant federal and state legislation. The field investigation was conducted during the last week of March 2018. Ms. Christine M. Longiaru, M.A., was the Principal Investigator for the historic structures investigation, Mark A. Steinback, M.A., was Project Historian; and Dr. Michael A. Cinquino, RPA, served as Project Director.

1.2 OPRHP PROJECT CONSULTATION

OBG provided the NYS OPRHP with preliminary information for the proposed Project in September 2016. An OPRHP Project Review Cover was submitted in October 2016 and assigned an OPRHP/SHPO Project Review #16PR06600. The OPRHP requested an inventory of all standing buildings and structures within the project area boundaries for their review to assess/evaluate the potential State/National Registers eligibility of all properties. Building information provided in this report will assist the OPRHP with their evaluation of the historic significance of all buildings/structures/historic districts within or adjacent to the project area.

1.3 METHODOLOGY

Panamerican accessed OPRHPs CRIS to identify previously inventoried historic resources and historic districts located within or adjacent to the APE. Electronic copies of relevant OPRHP Building Inventory Forms (late 1970s) and National Register Nomination Forms were obtained from CRIS. Background research included review of previous cultural resources studies in the study area, county and town

¹ As part of the Project's cultural resource investigations, Panamerican also conducted a separate Phase 1A archaeological study, which will also be submitted to the New York State Office of Parks, Recreation, and Historic Preservation (Hanley et al. 2018).

histories, and related online sources and websites. Maps consulted include the following: 1858 *Gillette's Map of Oneida Co., New York* (Beers et al.); 1838 *Utica, Atlas of New York* (David Burr); 1874 *Atlas of Oneida County, New York*. (D.G. Beers & Co); 1907 *New Century Atlas of Oneida County, New York* (Century Map Co.); Sanborn Maps (1884-1986); and selected USGS topographic maps. Aerial photographs and Google Earth current and historical imagery were also accessed. All street addresses were obtained from the city's real property assessment information.

A pedestrian survey limited to visual inspection of the exterior of buildings from public rights-of-way in the APE was conducted in March 2018. All buildings in the Project APE were photographed with a digital camera. Information gathered for each building included the following: location, approximate date of construction (i.e., circa date); architectural style; physical characteristics; building materials; integrity of the resource; and other defining features.

A tabular list of all buildings in the Project APE and their current S/NRHP eligibility information is presented in Section 4 of this report (Table 4.1). The building inventory is included in Appendix A in an annotated list format arranged in alpha-numerical street address order. Building descriptions and current photographs are included in the inventory. As noted above, recommendations of S/NRHP eligibility are not provided in this Phase 1A inventory. The locations of all documented buildings are identified by street address on a project map (see Appendix B).

Figure 1.3. Project Site Plan in City of Utica, Oneida County, New York (MVHS 2018).

2.0 Historic Background

2.1 CULTURAL BACKGROUND

Pre-European Period (1500-1650). During the late prehistoric and Contact periods (AD 1500-1650), tribal clusters of Iroquoian-speaking peoples were distributed throughout New York State and lower Ontario. Comprising several thousand people in at least one, and usually several, villages in proximity to one another, each tribal cluster was separated from the others by extensive and widespread hunting and fishing areas (Trigger 1978:344; Engelbrecht 2003). Native American groups in central New York were profoundly affected by the introduction of the fur trade, long before the arrival of a permanent European-American population in the area. This period dates the beginning of the end of traditional native cultural patterns due to ever-increasing political, military, religious and economic interactions with Europeans.

Cultural changes during the late prehistoric period laid the groundwork for the development of the individual nations of the Haudenosaunee Confederacy during the historic period. Archaeologists generally agree that the historic Haudenosaunee nations were preceded in their home territories by Haudenosaunee ancestors during the late prehistoric era. This interpretation is based partly on settlement patterns. In both prehistoric and historic times, Haudenosaunee nations moved their villages at intervals that may have been related to the exhaustion of local resources, such as soil, wood or game. Sequences of village movement spanning the prehistoric, protohistoric/Contact, and historic periods have been inferred for each of the individual Haudenosaunee nations, for example the Seneca (Wray and Schoff 1953; Wray et al. 1987); Seneca and Cayuga (Niemeczyki 1984); and the Oneida (Pratt 1976). The Oneida generally occupied the area encompassing the area around Oneida Creek and Oneida Lake, west of the project area, with control of Wood Creek and the Upper Mohawk Valley (Parker 1922; Campisi 1978:481).

Pratt (1976) identified a cluster of Oneida sites in the hills southwest of the great eastern bend in the Mohawk River at locations on defensible elevations near small streams. The cluster of sites represents a sequence extending from about the fourteenth or fifteenth century into the historic period. Bradley (1987) has classified the sites at the western end of Oneida Lake as components of the Onondaga nation.

By the historic period, however, the Oneida communities had joined again as one principal Oneida village when visited by Harmen Meyndertsz van den Bogaert in the winter of 1634-1635. Based on historical records, the Oneida resided in a single village throughout the seventeenth century (Campisi 1978; Pratt 1976; Gehring and Starna 1988; Curtin 1995).

Colonial Period (1600-1780). The French explored the St. Lawrence River valley and the Great Lakes region beginning in the sixteenth century, and the Dutch made in-roads in the Hudson and Delaware river valleys in the seventeenth century. European activities in what is now central New York State were limited for almost all of the seventeenth and eighteenth centuries. As noted, the first European to visit the Oneida was Harmen Meyndertsz van den Bogaert in 1634 from Dutch Fort Orange. Reputed to be near what is now Munnsville, in Madison County, southwest of the project area, the village was palisaded and had 66 longhouses, indicating a multiple-family household pattern (Pratt 1976:37, 134; Gehring and Starna 1988; Campisi 1978:481). Later, Jesuit missionary Jacques Bruyas established the mission of St. François Xavier among the Oneida in 1667. While the sowing of Christianity among the Haudenosaunee by the Jesuits generally bore little fruit, the missions had modest effects on reducing the hostility between the Haudenosaunee and the French. The Haudenosaunee and the French would not achieve peace until after 1700 (Abler and Tooker 1978:505-506; Campisi 1978:481-482).

With their seizure of New Netherlands from the Dutch in 1664, the English became the patrons of the Haudenosaunee. For the English, as it had been earlier for the French, the fur trade became an essential imperial concern, and subsequent competition with the French around the Great Lakes resulted in the erection of fortified trading posts within the frontier. Moreover, the imperial rivalry between the English and the French over the fur trade affected their Native American clients, who were forced to ally themselves with one or the other kingdom. While attempting to play one European power against the

other, Native nations continued to be drawn into the incessant conflicts that marked the Europeans' struggle for colonial empire (Abler and Tooker 1978).

As the frontier moved west during the eighteenth century, many military engagements between the French and British—and their Native American allies—would be centered on control of the Oneida or Great Carrying Place (in the area that is now the City of Rome). This area was where Mohawk River and Wood Creek flowed near enough to one another that a canoe or bateau could be carried overland from one stream to the other. The key was that the Mohawk River flows easterly into the Hudson River, and Wood Creek, just a mile and a half away, flows westerly into Oneida Lake, and ultimately, through the Oneida and Oswego Rivers, into Lake Ontario. Therefore, the Great Carrying Place (or, in short, the Carry) formed part of a natural channel of navigation linking the Great Lakes and areas inland to the Hudson River and the coastal lands of the Atlantic Ocean. Whoever controlled the flat, marshy land between them could dominate trade and threaten the existence of the Haudenosaunee Confederacy (Larkin 1977:31; Ellis 1977:37; Canfield and Clark 1909:35; Wager 1896:3).

Figure 2.1. Land comprising “Cosby’s Manor” and the “Oriskany” Patent as shown on the 1779 map of the Province of New York. The approximate location of the project area is indicated by red circle (Sauthier 1779).

The first land grant in Oneida County, the Oriskany (Ochriskeny) Patent, was granted in 1705 to a consortium headed by Thomas Wenham. It comprised land that straddled both sides of the Mohawk River for two miles from Wood Creek to east of “Ochriskeny” Creek, and both sides of Oriskany Creek, encompassing more than 30,000 acres (Figure 2.1). The area is just west of the project area. The patent specified an enormously high quitrent (for its location) of ten shillings, which restricted settlement for more than 80 years, and curiously did not require the patentees to improve or settle the land as almost all other patents required. This land grant included the economically important Oneida Carry as well as navigable portions of the Mohawk River and Wood Creek (Cookenham 1977:45-46; Wager 1896:95-101; Higgins 1976 [1931]:84). In 1756, the Lords of Trade in London recommended to New York Governor Sir Charles Hardy “that he present the facts to the Council and Assembly with a view to securing a law vacating such patents as the ... Oriskany because their fraudulent grants were one of the principal causes of the decline of the English interests with the Indians. Governor Hardy did not attempt to obtain this legislation” (Higgins 1976 [1931]:84). About this time the Oneida village of Oriska was situated near the confluence of

Oriskany Creek and the Mohawk River. The word “oriska” derived from the Oneida word meaning “place or stream of nettles” (Lord 1993).

The current project area is located in what was the west central portion of Cosby’s Manor, south of the Mohawk River (see Figure 2.1). William Cosby was Royal Governor of New York and New Jersey from 1732 to 1736. In 1725 a group of Germans with permission from New York Governor William Burnett acquired two parcels of land on both sides of the Mohawk River west of Little Falls from the Haudenosaunee, with which they did nothing for nearly ten years. In 1734 the title to the western parcel was patented to Joseph Worrall and ten associates and the title to the eastern parcel was patented to John Lyne and eight associates. Nine of the patentees in each patent were the same. Both parcels were conveyed to Governor Cosby six days later, and the combined tract is referred to as Cosby’s Manor, although Cosby never lived there. Cosby died in 1736 leaving the land to his two sons and his widow. The sons died intestate and Cosby’s widow, Grace Cosby, sold the lands north of the Mohawk River (approximately 21,000 acres) to Oliver De Lancy, Goldsboro Banyar, James Jauncey, and Peter Remsen between 1761 and 1767. However, a problem was discovered with the quitrents as well as the actual size of the parcel which scuttled the deal. A portion of the tract in present-day Oneida County was purchased by a group of investors led by Philip Schuyler at sheriff’s sale in July 1772. Schuyler acquired approximately 8,000 of the tract’s acreage. Still retaining the designation as Cosby’s Manor, the tract was surveyed by John Bleeker in 1786 (Bagg 1892:20-21; Wager 1896:98-103; Curtin et al. 1999:15-16).

While Dutch, French, and English traders and missionaries were the first visitors to the Mohawk Valley, the first permanent European settlers of the area were German refugees, largely from Lower Palatinate (present-day southwestern Germany near Luxembourg). More than 3,000 Palatine refugees left England for the Province of New York in January 1710; more than 700 died on the journey over or while in quarantine on Nutten [later Governor’s] Island. They were initially settled in the mid-Hudson Valley (north of present-day Kingston) to work, serf-like, for the English government in order to “raise hemp for cordage, and to manufacture tar and pitch, so that the government would no longer be obliged to buy these much-needed commodities for ship-building from other countries” (Cronau 2000; see Benton 2001 [1856]). Robert Hunter had devised a scheme to supply necessary products to the British Navy and petitioned the Board of Trade to provide a labor force for his project. As a result, Palatine refugees, who had flocked to London to escape dire economic conditions in their homeland (in general, the Lower Palatinate and neighboring states) would be resettled in the colonies to provide labor under Hunter’s “Naval Stores” project, among other locales in the British New World (Witthoff 1999; Otterness 2004:72-74). In 1710, while Hunter was appointed Governor of New York, the Palatines were resettled on lands purchased from Robert Livingston of Livingston Manor (in exchange for the contract to provision the immigrants) as well as on tracts on the west shore of the Hudson River in what is now Ulster County (Witthoff 1999). For a variety of reasons, the project was a total failure and the Palatines were left to fend for themselves. Nearing starvation, 50 families relocated to the Schoharie Creek area, with the consent of the Indians in October 1712 (Witthoff 1999; Otterness 2004).

As a result, the limits of European homesteading crept further into Oneida and Haudenosaunee territory during the first half of the eighteenth century. From the first furrows of German settlement near Schoharie Creek, additional Palatine settlements took root farther west along the Mohawk River. In 1723, the first permanent European settlement in what would become known as the Town of German Flatts was established as part of the Palatine German community within the so-called Burnetsfield Patent of 1725 (Benton 2001 [1856]; Otterness 2004). Governor Burnet had secured the land from the Mohawks for settlement as well as to establish a buffer between French traders in Canada and English settlements along the Hudson and lower Mohawk. Palatine settlement at what is now Herkimer (also referred to as Burnetsfield) was the westernmost European-American settlement along the Mohawk River in the 1730s (Otterness 2004:142-145).

In 1722, the British built a trading post at Oswego (becoming Fort Oswego by 1727), and carried on considerable trade between Oswego and Albany through Oneida territory until the American Revolution, making it the most important British outpost west of the Hudson. As a result, securing the Carrying Place (or *Deo-wain-sta*, the place where a canoe is carried between two streams, as the Oneida called it) became a matter of great importance, and military outposts were subsequently erected to protect the

route. Fort Williams (near Rome) would be established in 1746 and Fort Bull on Wood Creek at the Carry in 1755 (Lord 1993). Other British forts were constructed or begun during the hostilities with the French in the 1750s at or around the Oneida Carrying Place, as well as along the Mohawk River to the east. Fort Schuyler was established at what would become Utica in 1758 (see Figure 2.1).

During the French and Indian War, Native Americans allied with France conducted raids in the Mohawk Valley, with the Palatine settlements at the edge of the frontier bearing the brunt of the carnage. The area around Fort Herkimer was attacked twice. In November 1757, the settlers took refuge in the fort as the French and their allies attacked the settlement on the north side of the river: approximately 30 houses were abandoned, and gristmills and sawmills were burned. A second attack occurred the following spring, this time on the south side of the river. Many of the settlers again took refuge inside the fort, and those who did not reach the fort were either killed or scalped (Herkimer County Historical Society 1992:35). During the war, two separate movements of British forces, the first under the command of Lt. Colonel James Bradstreet (which captured Fort Frontenac on the north side of Lake Ontario in 1758) and the second under Brigadier General John Prideaux (which captured Fort Niagara in 1759), used the Mohawk River-Wood Creek route to reach the staging area for their advance to the site of their engagements with the French.

The initial settlement at what is now Utica was a military work built in 1758 at a fording place in the Mohawk River, which was constructed there during the French and Indian war. Designated Fort Schuyler (later referred to as "Old Fort Schuyler"), it was an earth embankment surrounded with palisades on the south bank of the river in what is now the eastern part of the city (Wager 1896:278; Bagg 1892:17). It was named for Colonel Peter Schuyler. Also constructed in 1758, Fort Stanwix was erected at the Carrying Place in what is now Rome. This fort marked the western boundary of legal British settlement from 1768 to 1783. With the French threat extinguished at the end of the French and Indian War, Fort Schuyler, like other frontier fortifications, fell into disrepair and was largely abandoned by 1768. With the return of peace, the migration of homesteaders into frontier and Haudenosaunee territory recommenced. This aggravated relations with the Native nations already living and hunting there. While no permanent settlements had been established in the lands south or west of German Flatts, the erection of forts and trading posts had caused uneasiness among the Haudenosaunee (Tooker 1978:434).

At Fort Stanwix, the Haudenosaunee signed the "Property Line Treaty of 1768" which ceded to the British all lands east of the Allegheny Mountains (including territory not actually under Haudenosaunee control), excepting reservations of Mohawks and others, for the purposes of settlement. The eastern half of Oneida County, including the project area, is east of the 1768 Property Line and its control was ceded to the British under the provisions of the treaty (Tooker 1978:434-435). Settlement was deterred by the growing animosity between the British and the colonists along the Atlantic coast. This hostility renewed the strategic importance of the area surrounding the Oneida Carrying Place and the Mohawk Valley. As a consequence, the colonials fortified the existing posts in the frontier, such as Fort Schuyler, and erected several new fortifications, such as Fort Dayton at what is now the Village of Herkimer in 1776 (Benton 2001 [1856]).

During the American Revolution, both the British and Americans enlisted the aid of individual Haudenosaunee nations in their battles in the frontier. Although the Confederacy itself maintained an official policy of neutrality, several of the nations (i.e., Mohawk, Onondaga, Cayuga, Seneca) allied with Great Britain and several (i.e., Oneida, Tuscarora) with the Americans. As part of their strategy to cripple the frontier economy by disrupting agricultural activities, the British enlisted their Haudenosaunee allies to participate in raids on isolated farming communities. Further, British Major General John Burgoyne saw control of the Mohawk Valley as an important element in his strategy to split New England from the rest of the rebelling colonies and snuff out the revolutionary fire. Part of his plan involved the advance of forces under the command of Lt. Colonel Barry St. Leger from Oswego through the Carry, destroying Fort Stanwix and the American defenses in the process, then down the Mohawk to join Burgoyne near Albany. Burgoyne was to make a clean sweep of everything from Lake Champlain south. The third component of the plan called for Sir Henry Clinton to advance north through the Hudson Valley with his forces from New York City. The confluence of these forces never materialized (Ellis 1977:38).

Leaving Oswego on July 26, 1777, St. Leger's force of British Regulars, Hessian infantrymen, artillerymen, Tory Rangers, and as many as 1,000 Indians (led by Mohawk Chief Joseph Brant [Thayendanega]) besieged the refurbished Fort Stanwix (renamed Fort Schuyler after its refortification by the Patriots and, as a result the former fortification called Fort Schuyler at what is now Utica was referred to as "Old Fort Schuyler") beginning on August 2. Brigadier General Nicholas Herkimer commanding the Tryon County militia set off from Fort Dayton to relieve the siege. They were joined by approximately 60 Oneida at the Oneida village of Oriska near the confluence of Oriskany Creek and the Mohawk River (Keesler 2004; Gould 2000; Ellis 1977:38-39).

However, before Herkimer's troops reached Fort Stanwix, they were ambushed by a detachment of Rangers, local Tories, and allied Native Americans beginning on the morning of August 6. The spot of the ambush was dense forest on high, undulating ground west of the marshy Oriska Creek. The intensely fought Battle of Oriskany raged for approximately six hours including an approximately one-hour break when the field was engulfed by a downpour. No one really knows how many were killed in the battle. One estimate has the Patriot militia losing between 450 to 500 men, excluding prisoners. The Americans retreated with their wounded to Old Fort Schuyler. General Herkimer was one of the casualties. Although he survived the battle, Herkimer bled to death at home eleven days later after a surgeon botched the amputation of his wounded leg. The British lost an estimated 200 men, not including the more than 100 Native Americans who were killed. The actual number was never tabulated. The militia never reached the fort (Ellis 1977:39-41; Gould 2000).

During the battle, Colonel (later Major General) Peter Gansevoort heard the gunfire and dispatched a sortie under the direction of Colonel Marinus Willett to help Herkimer. This detachment raided and destroyed a nearby camp of Native Americans and Tories, which lured them away from the main battle. Without their allies, the British withdrew, leaving the Patriots with the bloody field. After the engagement, the Patriots retrieved the wounded and returned to their Mohawk Valley farms, leaving the dead on the field (Ellis 1977; Gould 2000; Keesler 2004). The siege of Fort Stanwix continued for an additional 16 days until St. Leger received word that Major General Benedict Arnold was marching up the Mohawk Valley with a large force. St. Leger retreated back to Canada on August 22, ending the siege (Ellis 1977:42-44; Gould 2000).

In the aftermath of the Battle of Oriskany, Britain's Haudenosaunee allies in retaliation destroyed the Oneida villages of Oriska and Oneida Castle and their nearby fields and killing many of their occupants (Keesler 2004; Campisi 1978:483). The battle should be considered a Patriot victory, despite the failure of the militia to reach Fort Stanwix and relieve the siege, since the engagement ultimately prevented St. Leger from reaching Albany to assist Burgoyne at the Battle of Saratoga, one of the most important Patriot victories during the Revolution (Cookinham 1912:27-39; Keesler 2004). After Oriskany fighting on the frontier consisted largely of terrorist raids by the British and their allies on non-military settlements in the Mohawk, Unadilla, and Cherry valleys. Col. Willet and his militia, headquartered at Fort Plain, fought a guerilla-style war with Loyalist forces in the area. Several skirmishes also occurred in the Mohawk Valley, including the Battle of Klock's Field (1780), Johnstown (1781), and the Tory raid of Currytown (1781). American forces evacuated to areas east, and all European-American settlements prior to 1784 were destroyed and the area was reputed to have returned to wilderness. Since the Patriots had renamed Fort Stanwix Fort Schuyler, the fort formerly called Fort Schuyler was referred to as Old Fort Schuyler. After the close of the war, frontier fortifications such as Fort Schuyler and Fort Stanwix fell into ruin by the late 1780s. (Durant 1878:369; Wager 1896: 512; Cookinham 1912:39).

Early Statehood Period. During the Revolution most of the individual Haudenosaunee nations had sided with the British, while the Oneida and many of the Tuscarora sided with the Patriots, as a result of the influence of Samuel Kirkland. After the war, "[t]he Americans and the Six Nations signed a treaty at Fort Schuyler [formerly Fort Stanwix] in 1784. By its terms all of the Iroquois tribes, except the Oneida and Tuscarora, lost most of their lands. Because of their service to the Americans, the Oneida and Tuscarora retained ownership of all their land" (Lenig 1977:29-30). Further, New York State prohibited the purchase of Indian land by individuals and voided all such purchases made without legislative approval after 1775. These gestures, however, did little to protect the Oneida, who sold present-day Broome and Chenango counties to the state for \$15,500 in 1785. In a treaty signed between the Oneida and the State of New York in 1788 at Fort Schuyler (formerly called Fort Stanwix), the Oneida ceded to the state all their land

east of Oneida Lake, except for the Oneida reservation (which was formally established as a result of this treaty). Initially comprising about 300,000 acres in what are now Oneida and Madison counties, the reservation was affirmed by the 1794 Treaty of Canandaigua. By the end of the 1830s, most Oneida had relocated to Wisconsin, leaving approximately 157 Oneida on their ancient territory as of 1845 (Durant 1878; Lenig 1977:30; Campisi 1978:484-485).

Although the first grant of land in the territory that would become Oneida County occurred with the Oriskany Patent in 1705, homesteading did not begin in earnest in the area until 1784 and the second Treaty of Fort Stanwix. The earliest settlement in what is now Utica occurred in 1773 at Deerfield Corners by Mark Damuth, Christian Reall, and George J. Weaver and their families. However, they fled their homes with during the British depredations a few years later. Settlement did not return until 1784. One of the Damuths settled at the old Fort Schuyler section of Utica in 1785 (Jones 1851:141-142; Greene 1924).

About the same time, in 1784, Revolutionary-war veteran Hugh White arrived from Connecticut to settle what became Whitestown. By 1787, European-American settlement west of what is now the City of Utica consisted of three log houses at Old Fort Schuyler (Utica), seven at Whitestown, three at Oriskany, five at Fort Stanwix, and three at Westmoreland (Webster 1977:219; Canfield and Clark 1909:87; Jones 1851:371). Shortly after the restoration of peace, the owners of the Oriskany Patent who had not sided with the British during the Revolution began the process of subdividing and developing their tract. (Those patentees who had sided with the British had their lands confiscated.)

Cosby's Manor was surveyed by John R. Bleeker in 1786. The subsequent map depicted three houses near the ford, and some improvements both a little farther east near the present city limits and a little farther westward; "otherwise the region was covered with an unbroken forest" (Wager 1896:278-279). These houses were identified as occupied by John Cunningham, Jacob Christian, and George Damuth. In 1787 settlement at what is now Utica consisted of "three log huts or shanties, near the old Fort" (Child 1869). Settlers of Utica before 1800 included Uriah Alverson, Philip Morey and his sons, Sylvanus, Richard, and Solomon, Francis Foster, Stephen Potter, Joseph Ballou, Jason Parker, John Cunningham, Jacob Crestman, Peter Smith, John House, Matthew Hubbell. Businesses established themselves near the river, since that was the primary means of travel and much of the surrounding area was swampy. John Post was the first merchant trading with the Indians as well as sources in Schenectady ca. 1790, a primary product was said to be ginseng (Child 1869). He also kept the first tavern in the town. Ca. 1794, Moses Bagg, a blacksmith, operated an early tavern in the eastern portion of the town.

Efforts soon began to improve the regional transportation systems to facilitate the movement of goods and people into and from the area. During the 1790s, river improvements, the erection of a bridge over the Mohawk River at Old Fort Schuyler, and funding for the extension of the Genesee Road through Old Fort Schuyler to Geneva (later referred to as the Seneca Turnpike) provided an economic jolt to the community (Child 1869; Bagg 1892:17-18). The importance of removing the obstacles in the Mohawk River to better inland navigation was recognized immediately. In 1792, the Western Inland Lock Navigation Company (WILNC) was incorporated by the New York Legislature to improve the route between Schenectady and the Oneida Carry near Fort Stanwix. "The directors of the company appointed a committee consisting of General Schuyler, Elkanah Watson and Goldsboro Banyar to examine the state of the Mohawk River to Fort Stanwix and across the portage to Wood Creek" (Wager 1896:216). WILNC constructed several canals along the Mohawk River beginning in 1797 (Shaw 1990; Lord 1993; Larkin 1977:32). By 1800, Utica had 70 buildings and Rome 50.

The Town of Whitestown was created from the Town of German Flats in 1788. Ten years later, in 1798, Oneida County was formed and Old Fort Schuyler was incorporated as the Village of Utica. Utica and Whitestown shared the role of county seat until 1854. At the time of its incorporation, Utica contained 50 houses with more than 200 people. By 1804, the village supported "four tanneries, two nail factories, two breweries, a hat factory, and a cabinet maker, watchmaker, potter, shoemaker, rope maker, besides other shops, stores, taverns, two churches, a school house, barns and other buildings" (Greene 1924). In 1805, Utica was still relatively compact with only Main, Whitesboro, Genesee, Hotel, and Seneca streets in use, although other streets had been planned. "Business found its way from the river as far up Whiteboro as

Hotel street, as far up Genesee as the upper line of Broad, and a little way along Main; beyond these limits shops and stores were sparingly intermingled with private residences” (Bagg 1892:84).

As population spread westward and commerce increased along the Mohawk River, land roads proved insufficient to meet the needs of the expanding population. Further, after disappointing results along the western frontier during the War of 1812, a full water route to western New York was put into development. In July 1817 construction of the Erie Canal began at Rome. The route through Oneida County was location in and along the Mohawk River and the low swampy areas around it. The first trip in the canal was completed from Utica to Rome on October 22, 1819 (Bagg 1892:143, 222). The WILNC was liquidated in 1821 and its assets subsumed within the Erie Canal project. The Town of Utica was created from the Town of Whitestown in 1817. Utica was incorporated as a city in February 1832.

The canal connected Buffalo on Lake Erie with New York City on the Atlantic seaboard when it was completed in October 1825. Its route in Oneida County was along the south side of the Mohawk River and ran through what is now the City of Utica. Soon after completion, hamlets and villages sprang up along the route. The success of the canal was almost immediate and the volume of goods and people increased at such a pace that the canal had to be expanded in the 1840s and 1860s (Shaw 1990).

During the nineteenth century, the Erie Canal allowed for the growth of valley villages as the economical means of transportation supported both agricultural and commercial/industrial development. Prior to the opening of the Erie Canal, the Mohawk valley had been the most productive wheat granary in the nation. This changed dramatically when Genesee valley farmers were able to ship their products along the canal to Albany, which, at that time, was the wheat market center of the nation. As the nineteenth century progressed, Mohawk valley farmers concentrated their efforts on dairying and cheese production, which had been practiced to some extent even prior to canal completion. Re-envisioned at the end of the nineteenth century, the Erie Canal was reconstructed as the New York State or Erie Barge Canal between 1903 and 1917 (Wager 1896; McFee 1998).

With the success of the Erie Canal, other areas of the state clamored for a canal to link to the Erie. Authorized in February 1822, the Chenango Canal project connected the Susquehanna River at Binghamton to the Erie Canal at Utica at the western end of the current project area. Construction of the 97-mile canal began in July 1834 and was completed in October 1836. The importance of the Chenango Canal rested on its utility for bringing Pennsylvania coal north to the growing factories of Utica (Wager 1896:223). Construction of the Chenango canal spurred the development of the surrounding neighborhood. In proximity to the junction of the Erie and Chenango canals, three large factories were built between 1846 and 1848, including the Utica Steam Cotton Mills (on State Street). In addition to factories, dwelling were also erected. The Rome and Utica Plank Road opened in 1848 along the route that is now Whitesboro Street (McFee 1993:180-181).

However, the successes of canal movement encouraged competition from a developing technology—railroads. The construction of the Utica & Schenectady Railroad began in 1834 and the line became operational in September 1836. The Syracuse & Utica Railroad was completed in July 1839. Paralleling the Mohawk River on the south, the line was consolidated into the New York Central in 1853 as was the Utica & Schenectady Railroad. Its passenger service was subsumed by AMTRAK in 1971 and its freight service by Conrail in 1976 (Wager 1896: 225-226; Herkimer County Historical Society 1992:138, 141). This was the primary line in the county until the 1880s. In 1881, construction began on the New York, West Shore & Buffalo Railroad, which ran west from Utica. Declared bankrupt in 1884, the line was leased to the New York Central in 1885. It ceased operations in 1966 (Herkimer County Historical Society 1992:138, 142-144; Larkin 1977:34). Other railroad lines in the city included the Utica, Chenango & Susquehanna Valley Railroad (finished in 1870 and leased to the Delaware, Lackawanna & Western Railroad); the New York, Ontario & Western Railroad; and the Utica, Clinton & Binghamton Railroad (this line was leased to the New York & Oswego Midland Railroad, and later to the Delaware & Hudson Canal Co. in 1875) (Wager 1896:227-228).

Initial settlers to the Utica area comprised a mix of New Englanders, Dutch, German, and Welsh people. Later immigration brought in by the Erie Canal drawn by the need for labor for the construction of the

Chenango Canal and the railroads included Irish and German workers, who later worked in Utica's mills, factories, and domestic service. Population of Utica increased from 2,972 in 1820 to 12,782 by 1840, and to 23,686 in 1865 (Child 1869).

During the nineteenth century Utica was a manufacturing center in the Mohawk Valley. Near both reliable transportation routes and fertile agricultural fields, Utica became a convenient location for the creation and distribution of goods and products. Although the lack of water power was initially a hindrance to larger-scale manufacturing, this was overcome by the completion of the Chenango Canal, which brought Pennsylvania coal to feed the steam-power needs of the city (Wager 1896:366). Early manufacturing operations included Ephraim Hart's foundry, which began in 1822 (it became Hart and Crouse by 1896); several grist mills along the Mohawk River in the 1820s; two antecedents of Central New York Pottery; and the Vulcan Works (founded in 1832 and became the Utica Steam Engine and Boiler Works in 1896). In addition, the Munson Brothers foundry, machine shops, and mill machinery factory was established in 1823 by Alfred Munson. The firm later became Hart and Munson, then Munson Bros. in 1868 (Wager 1896:367). A planing mill was established by Philo Curtis, which was making sashes, doors, and blinds by steam power by 1834. The firm passed through several hands and was called Charles C. Kellogg & Sons by 1896. Metcalf & Dering and Edward F. Downer & Sons were other lumber mills at the end of the nineteenth century.

Utica was a center for textile manufacturing, including oil cloth, beginning in 1832. Some notable nineteenth-century companies included James B. Martin; William Taylor & Co.; Rockwell, Rhodes, & Miller; Roberts, Butler & Co.; Owen, Pixley & Co., later H. D. Pixley & Son and Owens Bros.; Crouse & Brandegees; Utica Clothing Co.; Utica Steam Woolen Mills (1846), and Utica Steam Cotton Mill (1847). Successful firms also included the Globe Woolen Mills which was established as the Utica Globe Mill Co. in 1847 and employed approximately 1,000 workers at its height. Most mills were located in West Utica in the neighborhood of the Chenango and Erie canals, which attracted numerous German and Irish immigrants to work and live. New textile mills opened during and after the Civil War, including Utica Steam Knitting Mill (1863) Oneita Knitting Mill (1878), Mohawk Valley Cotton Mill (1880), the Skenandoa Cotton Company (1881), and Utica Knitting Company (1890), among others. Some of these were opened in the east side of the city. More than 11,000 workers were employed in Utica's textile mills at the end of the nineteenth century (Wager 1896:368-369; Pristera 2009:8, 10).

Iron makers, forges, and foundries were also quite successful and included Phoenix Iron Works (founded in 1852); Russel Wheeler & Son (1842), The Carton Furnace Company (1847), Irvin A. Williams & Co. (1851, maker of locomotive head lights); Utica Steam Gauge Company (1861); and Utica Pipe Foundry Company (1889). Other prominent companies included Utica Knitting Company (1863, reorganized 1891); Wild & Devereux (1874); the Mohawk Valley Cap Factory Company (1868); Empire Scotch Cap Factory (1887); Utica Burial Case Company (1890), as well as a numerous shoe manufacturers and breweries (Wager 1896:370).

Post-Civil War Period. The necessities of the Civil War ushered in a new era of industrialization, one geared toward greater concentration of manufacturing and heavy industry in northern industrial centers, facilitated by rail transportation. By 1869, the City of Utica was a nexus of numerous transportation routes. The Genesee turnpike, the Erie Canal, and the New York Central extended through it. It served as the northern terminus of the Utica, Chenango, & Susquehanna Valley and the Utica, Clinton & Binghamton railroad as well as the Chenango Canal. It was the southern terminus of the Utica & Black River Railroad. The city was serviced by several horse railroads as well as stages. In addition, it supported 30 churches, 11 banks, numerous manufacturing operations, producing textiles, steam engines, musical instruments, telegraphic materials, and other items (Child 1869). The notable companies at that time included, the Globe Woolen Mills, the Utica Burr Mill Stone Manufactory (Hart & Munson), the Wood & Mann Steam Engine Company, and the Utica Steam Gauge Company, in addition to some of textile mills noted above (Child 1869). The New York State Lunatic Asylum (Utica State Hospital; opened 1843, closed 1978; designated a National Historic Landmark in 1989) was west of the project area (Larkin 1977:35; Beers et al. 1874 [Figure 2.2]). The abundance of rail options as well as the more regular service resulted in the replacement of the Chenango Canal for shipping coal and freight. The Chenango Canal, west of the project area, closed in 1878. Rail transport and industrial jobs

encouraged the arrival of numerous Italian and Polish immigrants after about 1870 (Canfield and Clark 1909; Wager 1896; Sanborn 1888).

Figure 2.2. Approximate location of the project area in 1874 (Beers et al. 1874).

The economic situation of the communities encircling the City of Utica changed in the wake of growing industrialization and urbanization. Mercantile business formerly conducted in rural settlements outside the city was diverted to the city. As Wager noted, “one of the causes of this exodus from the country [to the city] is the changed condition of agricultural interests which have been brought about since the [Civil War], largely through the competition of the products with the great West, and partly through the general depreciation of rural real estate values” (Wager 1896:199-200). Land devoted to farming decreased, while the productivity of that land rose, especially in the twentieth century. Between 1875 and 1969 the acreage being farmed decreased from 704,363 acres to 319,806 acres. Cattle raising and dairying became more profitable and began to replace grain production, with over 500,000 acres devoted to livestock in 1879. By 1900, Oneida County was rated first in the annual production of cheese and dairy products (Crisafulli 1977a).

Equally important to the shift in farm production was the trend toward more owner-farmers and less tenant farmers. Almost 75 percent of the farms in Oneida County were owner-operated by World War I. Moreover, improvements in mechanization and the introduction of new and larger farm machinery enabled farmers to consolidate and expand their acreage. As a result, marginal farmers were forced out of business and the number of farms declined, but the remaining farms more than doubled in size. Therefore, as the economy of the City of Utica became more industrial and commercially oriented, the countryside surrounding it became more rural as farms increased acreage and were owner-operated (Wager 1896:200, 532; Crisafulli 1977a:50-52, 1977b:103-106).

As a result of the increasing supply of workers, factories in Utica flourished between ca. 1890 and 1950. Textile mills and knitting factories were especially robust. Industry expansion included the emergence of Oneida Mills, Frisbie-Stansfield Knitting Company, and Utica Knitting Company as national leaders in the knit goods industry. Other large companies included the Mohawk Valley Cotton Mill which merged with the Utica Steam Cotton Company in 1901. The height of the Utica textile industry was 1910 when nearly two-thirds of the city’s inhabitants worked in textile-related industries (Kirk et al. 2012; Pristera 2009:12-14).

Transportation changes facilitated the industrial development as establishment of the textile industry emerged with the completion of the Erie and Chenango canal. Beginning in 1886 streets of the city began to be paved with asphalt, beginning with Rutger Street. In 1887, the Utica Electric Light Company began to provide street lighting, “starting in the business section, although lighting for residential districts...soon followed” (Morton 2010). The electric streetcar was introduced in the 1890s and an interurban electric line, Utica & Mohawk Valley, ran between Rome and Little Falls during the early twentieth century. The Utica Belt Line Railroad system ran along Lafayette, Columbia, and State streets (Larkin 1977:35; Beers et al. 1874; Century Map Company 1907).

With the closure of the Chenango canal, the northern end of the former canal was gradually turned into a reservoir for the Erie canal. The abandoned canal channel was ultimately filled, although it was still depicted as open in 1888 (Sanborn 1888, 1925). As noted the canal system was reimagined and modernized during the early twentieth century and the subsequent Barge Canal was completed in 1917 through Utica. Gradually filled, the former Erie Canal channel was leveled through the city by 1923 and became Oriskany Street. The North Genesee Arterial was completed in the 1970s (Morton 2010).

The textile industry began a slow decline after World War I as the industry was plagued by over supply and northern textile operations shifted work to mills in the South. While Utica supported more than 40 mills in 1910, only six survived in 1922. Further, transportation improvements like the trolley and later the automobile freed workers from living in proximity to their places of employments. This freedom resulted in workers, especially the better paid, seeking to find living arrangements in less crowded and noisy places and gave rise to suburban housing areas. By 1940 the city had a population of 100,518 (Pristera 2009:15-18).

After the war, General Electric opened a factory in Utica which expanded during the 1950s as the Cold War intensified. This factory helped offset the loss of textile jobs as GE employed more than 5,800 people at the close of the 1950s. During this period large infrastructure projects like the construction of the North-South Arterial (New York State Route [NY] 12), the East-West Arterial (NY 5S), and the Sauquoit Valley Arterial (NY 8) helped speed the development of residential suburbs and draw residents from the central city. In addition, the completion of the New York State Thruway (Interstate-90) north of the city in the mid-1950s helped commerce bypass the area. During the late 1950s and 1960s, urban renewal plans led to the demolition of numerous city buildings, which became vacant lots when proposed projects did not materialize. In 2006 structures in the area were demolished for a police support facility. A major economic development in the area during the twentieth century was the construction of the U.S. Air Force repair and maintenance depot, which served the entire northeastern section of the nation. This facility would develop into Griffiss Air Force Base, northeast of the City of Rome (Pristera 2009:20-21; Crisafulli 1977a:50-52, 1977b:105-112; Lehman 2016a, 2016b). The base closed in the late 1990s, although Rome Laboratories (now the Air Force Research Laboratory) continued to utilize buildings within the facility, which has become the Griffiss Business and Technology Park. The City of Utica had a population of 62,235 in 2010.

2.2 HISTORICAL MAP ANALYSIS.

Eleven historical maps and atlases were consulted for the project area (Rogerson et al. 1852; Beers et al. 1858 [Figure 2.3], 1874 [Figure 2.2]; Roe & Taylor 1868 [Figure 2.4]; Hopkins 1883 [Figure 2.5]; Sanborn 1884 [Figures 2.6], 1888 [Figure 2.7], 1925 [Figure 2.9], 1952 [Figure 2.10], 1986; and Century Map Company 1907 [Figure 2.8]). As expected for an intensely urban environment, the lots in the project area contain numerous buildings and structures. A selection of historical maps was used to prepare a list documenting the structures at each current address in the project area and details its development over time. The results of this review are presented in Table 2.1, which appears after the historical map figures.

Figure 2.3. Approximate location of the project area in 1858 (Beer et al. 1858).

3.0 Architectural Summary

The Project APE is situated on the west side of the City of Utica's central business district on Upper Genesee Street. The study area is bound to the north by the former Erie Canal bed, which is now Oriskany Street West. This section of the city has been continuously occupied since the completion of the Erie Canal in 1825 (see historical maps in Section 2.2). Lafayette (or La Fayette on early maps) and Columbia streets are the two primary streets in the Project APE, both of which extend west from Genesee Street to beyond the western end of the study area. The study area is in the City of Utica's Scenic and Historic Preservation District and the Erie Canal-East section of the Erie Canalway National Heritage Corridor that includes the canalway between Albany and Rome.¹ Construction of the Erie Canal and later the Chenango Canal at the west end of the study area spurred the development of the surrounding neighborhood. In the 1920s, the Erie Canal was abandoned and gradually filled in. Oriskany Street (the East-West Arterial) was constructed on top of the former canal path.

The study area contains extant architectural resources associated with the Erie Canal era that date from ca. 1835 through the turn-of-the-twentieth century. The types of buildings represented include brick, three-story residences constructed in the Greek Revival and Italianate styles on Lafayette Street, remaining industrial buildings constructed as part of larger industrial works on the canal at Carton Avenue and mid-to-late nineteenth century and early twentieth century commercial/mixed-use buildings designed in the popular architectural styles of the period (Italianate; Romanesque Revival, Queen Anne, Neoclassical Revival; Early Twentieth Century Commercial). Extant commercial buildings share brick construction and range from one to four stories. Several buildings were modified with mid-century storefronts. The Utica Turn Hall/Utica Turn Verein at 506 Columbia is an example of a former social and athletic club for German immigrants that was active from roughly 1868 to 1919 (Mason 2017).

Columbia and Lafayette streets were flourishing urban corridors containing blocks lined with a variety of commercial, transportation, religious, social, recreation, and cultural buildings. Sanborn Fire Insurance maps dating from the 1880s through 1986 document the historic development of the study area as well as changes in building functions (see Table 2.1). Introduction of the Utica Belt Line Railroad trolley system in 1890 provided transportation to the city's central business district. The trolley ran along Lafayette, Columbia, and State streets. The city's transportation network expanded regionally with the establishment of the Utica & Mohawk Valley in 1901, which unified all city and interurban street car lines. A vestige of this former transportation system in the study area is an interurban trolley garage that was constructed on the southwest corner of Lafayette Street and Broadway in 1908. By 1925, the study area included several automobile-related businesses such included service stations, dealerships with showrooms, and auto part stores. With the rising popularity and reliance on the automobile, and the introduction of bus transportation, interurban streetcars were discontinued in Utica in 1941.

During the second half of the twentieth century, urban renewal projects resulted in the razing of large tracts in and adjacent to the study area. Most of the buildings on the south side of Columbia Street, between Broadway and State Street were razed. New construction on these blocks occurred during the 1960s and 1970s. During the 1960s, a new St. George's Roman Catholic Church complex was constructed at 425-429 Lafayette Street. Additional significant demolition occurred along Lafayette Street in ca. 2005-2006 for the construction of a new police facility on the block bound by Cornelia, Oriskany, and Broadway.² Other recent physical changes in the study area include a façade enhancement initiative which obscured the original facades and window openings of several commercial buildings. The block bound by Columbia, Cornelia, Lafayette, and Broadway represents the only cohesive urban block in the study area which mostly retains buildings constructed from ca. mid-nineteenth century through the early twentieth century. This block includes the former Berger's Department Store building, Jones Building,

¹ Scenic and Historic Preservation District Map (2004), City of Utica Department of Urban and Economic Development, online, <http://www.cityofutica.com/departments/urban-and-economic-development/boards/scenic-and-historic-preservation-district/index>. Note, the current map available on the City of Utica's website has not been revised to reflect changes since 2004.

² Pre-demolition and demolition photographs of are available online, City of Utica, Department of Assessment, <http://cityofutica.sdgny.com/index.aspx>.

Haberer Building, Charles H. Childs & Co. Building, and an Italianate building converted for commercial use (Metzers). However, neglect and vacancy over the years have resulted in the physical decline of the three buildings on the block (Jones, Haberer, Berger's buildings).

3.1 PREVIOUSLY IDENTIFIED HISTORIC ARCHITECTURAL RESOURCES

Panamerican utilized the OPRHP's CRIS to identify and review all previously inventoried historic resources and historic districts located in, adjacent to, and near the study area. The results of the CRIS search for State/National Registers-Listed and -Eligible (NRL and NRE) resources are enumerated in Table 4.1 (see map in Appendix B). Four existing NRE architectural resources are in the Project APE: 440 Lafayette Street (USN 06540.001491); 442 Lafayette Street (USN 06540.001490); 444 Lafayette Street (USN 06540.001489); and 506 Columbia Street (shares address with 509 Lafayette St (USN 06540.001555)). One historic district is partially in the Project APE, the NRL Downtown Historic District Utica. Seven historic districts are within approximately one mile of the Project APE (Table 3.1). NYS OPRHP staff provided additional information on the recently nominated NRL Downtown Historic District Utica.

Table 3.1. Historic Districts within approximately one mile of the project area.

OPRHP #	District Name	Distance to APE ft (m)	Time Period	Current S/NRHP Eligibility Status
06540.001910	Mohawk Valley Psychiatric Center Historic District	3,064 (934)	Historic	Undetermined
06540.001883	Globe Woolen Company Mills	1,546 (471)	Historic	Listed
06540.001874	Rutger-Steuben Park Historic District	1,269 (387)	Historic	Listed
06540.001876	Lower Genesee Street Historic District	825 (282)	Historic	Listed
06540.001996	Bagg's Square East Historic District	1,512 (461)	Historic	Undetermined
06540.001988	East Utica Little Italy Historic District	3,927 (1,197)	Historic	Eligible
00104.000641	New York State Barge Canal Historic District	2,693 (821)	Historic	Listed
06540.002058	Downtown Genesee Street Historic District	Partially in the APE	Historic	Listed

Previous cultural resource surveys were conducted adjacent to or in the vicinity of the Project APE for NYS Department of Transportation projects. In 2008, a large-scale cultural reconnaissance study was completed for the proposed extensive improvements and alterations to the North-South Arterial, which borders the west boundary of the study area (Kirk et al. 2008). Architectural reconnaissance survey was conducted in the western portion of the study area on Lafayette, State, Oriskany and Columbia streets at that time. In 2016, a section of the Project APE was previously inventoried as part of a cultural resources investigation conducted in 2016 for the NYS Department of Transportation Carrington and Hohman (2016). This earlier study included buildings on City of Utica parcels on the south side of Oriskany Street West, between Cornelia St and Broadway.

3.2 DOWNTOWN GENESSEE STREET HISTORIC DISTRICT³

The NRL Downtown Genesee Street Historic District (USN 06540.002058) is partially within and adjacent to the southern portion of the Project APE along Columbia Street (see Photographs 3.1-3.5). The 87.35-

³ Information on the NRL Upper Genesee Street Historic District and building descriptions were extracted from data available in CRIS (see USN 06540.002058 in CRIS). Note, the district is also referred as the Downtown Genesee Street Historic District.

acre historic district is centered on the City of Utica's central business district along Upper Genesee Street and encompasses 100 properties. The Upper Genesee Street Historic District has an irregular (although generally cruciform) shape, and is roughly bordered by Oriskany Street (the former Erie Canal bed) to the north, Park Avenue and John Street on the east, South Street, at the south, and State Street, on the west.

Three buildings in the Project APE are NRE and contributing resources to the Upper Genesee Street Historic District:

- 301 Columbia Street (USN 06540.002010)
- 608 Broadway (Building section in APE at 335 Columbia Street per parcel data [USN 6540.002007])
- 401-407 Columbia Street (USN 6540.002011)

The historic district's period of significance spans from 1825 to 1972 and includes all of the standing structures within Utica's central business district, exclusive of a few newer structures or additions made to older buildings. Collectively, these buildings "...reflect the zenith of the commercial prosperity of the City of Utica (between c. 1875 to 1930), the subsequent changes to the city wrought by the advent of car culture (1930 to 1958), and large-scale interventions undertaken during the Urban Renewal period (1958-1972)." The period of significance ends in 1972, and coincides with the end of the Urban Renewal program in the City of Utica with the completion of Kennedy Towers and the New York State Office Building. Kennedy Towers is adjacent to properties in the Project APE on the south side of Columbia Street between State and Cornelia streets.

The Downtown Genesee Street Historic District is significant under NRHP Criterion A for its association with the commercial and institutional growth of the City of Utica, and under NRHP Criterion C for Architecture (CRIS 2018). Its period of significance (1825-1972) incorporates the rise and subsequent fall of Utica as a regional commercial and transshipment hub for central New York State and the related rise and fall of the city's industries. The standing structures within the district demonstrate the linkage between Utica's advantageous location on the principal east-west transportation routes and the late-nineteenth century commercial expansion of the city. The district is significant for its architecture. Structures within the district embody the distinctive characteristics of commercial, institutional, and (to a lesser extent) residential structures of the period 1825 to 1972. Their designs reflect popular period architectural styles and aesthetics, and utilize characteristic construction technologies for the region. Greek Revival, Rundbogenstil (Round-arch style), Richardson Romanesque, Classical Revival, Art Deco, Moderne, International and other styles are represented. Construction techniques range from traditional braced framing (used in the oldest structures) to steel and concrete framing for buildings constructed near the end of the period of significance.

Photograph 3.1. View along Columbia Street from east of Broadway showing the section of the Downtown Genesee Street Historic District between Broadway and Cornelia Street, facing west (*Panamerican 2018*).

Photograph 3.2. View along Cornelia Street from the Downtown Genesee Street Historic District south of Columbia Street, facing north toward the proposed the Project (401 Broadway at left and 608 Broadway/335 Columbia Street at right) (*Panamerican 2018*).

Photograph 3.3. Contributing building at 301 Columbia Street (USN 06540.002010) to the NRL Downtown Genesee Street Historic District, facing southwest (*Panamerican 2018*).

Photograph 3.4. Contributing building at 608 Broadway (building section in APE at 335 Columbia Street per parcel data [USN 6540.002007]) to the Downtown Genesee Street Historic District, facing southeast (*Panamerican 2018*).

Photograph 3.5. Contributing building at 401 Columbia Street (USN 06540.002011) to the Downtown Genesee Street Historic District, facing southwest (Panamerican 2018).

Contributing Buildings adjacent to the Project APE:

Kennedy Plaza Apartments at 2 Kennedy Plaza was constructed in 1969-1972. The complex consists of three contributing buildings. Originally known by the name of “State Street Houses,” this complex of three buildings, two of five stories and one 17-stories in height, were designed by Ulrich Franzen & Associates, a nationally-known architectural firm located in New York, and most closely associated with “brutalism,” a late modern architectural style. The complex was renovated in 2011. Each of the buildings is faced with prefabricated panels of rectangular form. The horizontal joints follow the floor levels and extend uninterrupted around each building. Fenestration is chiefly located in corner insets or within recesses which articulate each structure into sub-units. Balconies are inset between setbacks on the five-story buildings; those on the 17-story tower are located at corners and between setbacks. Railings are of simple form with metal balusters. These balconies constitute the chief decorative feature of each building, which are otherwise without ornament. Dark colored panels demark a formal base for each building, and are used to emphasize principal vertical elements (typically, elevator shafts and fire stairs). The complex occupies a stepped landscape featuring stairs leading down from Court Street, retaining walls, and formal plantings. Three surface parking areas located to the northeast, northwest and south of the buildings, are also located on the property. The northeast parking lot and north lawn are adjacent to the Project APE.

3.3 EXISTING INDIVIDUAL NRE RESOURCES IN THE PROJECT APE

Four existing S/NRHP-eligible architectural resources are in the Project APE. At present, no photographs or descriptive building information is available for these four resources in CRIS. The row of three, ca. 1835-1845, buildings on Lafayette Street represent the oldest extant structures in the Project APE. Note, the three resources in the NRL Upper Genesee Street Historic District that are located in the Project APE are identified in CRIS as individual NRE resources (see Section 3.2).

- Utica Turn Hall/Utica Turn Verein, 506 Columbia Street (shares address with 509 Lafayette Street [USN 06540.001555])

- c. 1835 L. Snyder House (1907), 440 Lafayette Street (USN 06540.001491)
- c. 1835 S Isele House (1907), 442 Lafayette Street (USN 06540.001490)

3.4 INDIVIDUAL NRE RESOURCES ADJACENT TO THE PROJECT APE

The City of Utica Police Department Building at 413 Oriskany Street West (1924; Bagg & Newkirk, architects) is an existing individual NRE resource adjacent to the Project APE. It is located on the east side of Pine Street, which is now a pedestrian walkway. Open parking lots surround the building to the south.

Note, the NRE Utica Memorial Auditorium (400 Oriskany Street West; built in 1959) stands on the north side of Oriskany Street at Cornelia Steeet, opposite the Project APE. The auditorium is recognized by the American Society of Civil Engineers as a National Historic Civil Engineering Landmark.

3.5 INDIVIDUAL RESOURCES WITH “NOT ELIGIBLE” S/NRHP STATUS IN PROJECT APE

Six individual standing structures in the Project APE were previously determined not eligible for listing in the S/NRHP (CRIS 2018). One other property at 502-506 Lafayette Street (USN 06540.001565) has a USN building point and S/NRHP determination of not eligible. This parcel consists of a paved lot with a metal chain-linked perimeter fence.

- Commercial, 1-story (ABC ChemDry), 432 Lafayette Street (USN 06540.001552)
- Commercial, 2-story (UAP Engine Rebuilders), 446 Lafayette Street (USN 06540.001551)
- Commercial, 1-story (Urbank's) 501 Lafayette Street (USN 06540.001564)
- Commercial, 1-story (REB Demolitions), 510-512 Lafayette Street (USN 06540.001546)
- Commercial, 1-story, 401 State Street (USN 06540.001547)
- Commercial, 1-story (Maugeri's Auto) 402 State Street (USN 06540.001545)

3.6 INDIVIDUAL RESOURCES WITH “UNDETERMINED” S/NRHP STATUS IN PROJECT APE

Two individual standing structures located in the Project APE have not been evaluated for the S/NRHP and at present are identified with an “undetermined” status in CRIS: the Former Interurban Trolley Garage, 300-306 Lafayette Street (USN 06540.000101); and Utica Heater (Central NY Supply) 418 Lafayette Street (USN 06540.000554/ 06540.001553).⁴ Two other unevaluated resources identified in CRIS have been demolished: Hart & Crouse (Utica Plumbing) formerly at 332-334 Lafayette Street (USN 06540.000079) and Utica Steam Gauge/Salvation Army formerly at 400-406 Lafayette Street (USN 06540.000553).

⁴ Two USNs are assigned to the standing structure at 418 Lafayette Street in CRIS. The USN building point for 418 Lafayette Street (USN 06540.000554) is identified in the correct location in CRIS. A 1978 OPRHP Building Inventory Form was completed for the former Utica Heater (Central NY Supply) at 418 Lafayette Street. The other USN (06540.001553) has the associated street address of 418-424 Lafayette Street and a determination of not eligible for listing in the S/NRHP. The USN building point for 418-424 Lafayette Street is located on the east side of Carton Street and there is no other available property information in CRIS.

4.0 Results

Forty-nine (49) architectural resources were identified in the Project APE; 43 buildings older than 50 years of age and six buildings less than 50 years of age (see Table 4.1). Three contributing resources to the State/National Register-Listed Downtown Genesee Street Historic District are located in the Project APE: 301 Columbia Street (USN 06540.002010); 608 Broadway (Building section in APE at 335 Columbia Street per parcel data [USN 6540.002007]); and 401-407 Columbia Street (USN 6540.002011). Four existing NRE architectural resources are in the Project APE: 440 Lafayette Street (USN 06540.001491); 442 Lafayette Street (USN 06540.001490); and 444 Lafayette Street (USN 06540.001489); and 506 Columbia Street (shares address with 509 Lafayette Street (USN 06540.001555]). The survey documented thirty-four (34) resources that are not presently in the NYS OPRHP historic resource database (CRIS). The inventory of documented buildings is presented in Appendix A. The locations of all documented buildings are identified on the survey map at the end of this section (Figure 4.1).

Table 4.1 Inventory List of Architectural Resources					
	OPRHP USN	Resource Name	Address	Year built (circa)	Current S/NRHP Status
1		Fulmer Building	300-306 Columbia Street	ca. 1915-1924	None; not in CRIS
2	06540.002010	Early 20 th -century commercial building, brick, 4-story (Utica Paint Co. Building)	301 Columbia Street	ca. 1900	Eligible (I); contributing to NRL Downtown Genesee Street Historic District
3		Neoclassical Revival commercial building, brick, 3-story	308-310 Columbia Street	ca. 1915-1924	None; not in CRIS
4		Italianate (modified) commercial building, brick, 3-story	312-316 Columbia Street	ca. 1850s; mid-1930s; 1960s	None; not in CRIS
5		Early 20 th -century Commercial Style (modified); 1-story, brick	318-320 Columbia Street	ca. 1925	None; not in CRIS
6		Haberer Building	326-334 Columbia Street	1890s	None; not in CRIS
7	06540.002007	Kennedy Parking Garage (Broadway) and Mohawk Hospital Equipment, Inc. (Columbia Street)	608 Broadway (Building section in APE at 335 Columbia Street per parcel data)	1964-1970	Eligible (I); contributing to NRL Downtown Genesee Street Historic District
8		Jones Building	336 Columbia Street	1890s	None; not in CRIS
9		Art Deco, 1-story commercial building (Berger's/ Norm Seakan TV & Appliances)	338-358 Columbia Street	1944	None; not in CRIS
10		Italianate and Art Deco commercial building, 3-story (Berger's Department Store)	360-362 Columbia Street	mid-late 19 th century; 1944	None; not in CRIS
11	6540.002011	Columbia Place	401-407 Columbia Street	c. 1900; c. 1910; c. 1920	Eligible (I); contributing to NRL Downtown Genesee Street Historic District
12		Salvation Army	406 Columbia Street	1953	None; not in CRIS

Table 4.1 Inventory List of Architectural Resources					
	OPRHP USN	Resource Name	Address	Year built (circa)	Current S/NRHP Status
13		ca. 1990, 1-story office building (Danovitz Center for Equality)	409 Columbia Street	ca. 1971-1972	None; not in CRIS
14		ca. late 1970s commercial building, 1-story	411 Columbia Street	ca. late 1970s	None; not in CRIS
15		Commercial: 1-story, brick	430-432 Columbia Street	ca. 1880s	None; not in CRIS
16		Italianate commercial building, 3-story, brick (Turning Point Church)	436-438 Columbia Street	pre-1888	None; not in CRIS
17		Commercial building, 3-story, brick (Pete's Auto Parts)	452-454 Columbia Street	early 20 th century (ca. 1910)	None; not in CRIS
18		Carriage House, brick	456 Columbia Street	ca. 1890s	None; not in CRIS
19		Italianate, 2-story, brick	458 Columbia Street	mid-19 th century (ca. 1850)	None; not in CRIS
20		Witzenberger Building	460-464 Columbia St	ca. 1890s; 1960s	None; not in CRIS
21		Early 20 th century, mixed-use, 3-story (500 Columbia Street, LLC)	500-504 Columbia Street	ca. 1910s	None; not in CRIS
22	06540.001555	Utica Turn Hall/Utica Turn Verein	506 Columbia Street (shares address with 509 Lafayette Street)	ca. 1889-1898	Eligible (I)
23	06540.000101	Former Interurban Trolley Garage	300-306 Lafayette Street	1908	Undetermined
24		Commercial, 2-story, early 20th century (Clemente Novelties Inc.)	303-309 Lafayette Street	ca. 1907-1925	None; not in CRIS
25		Commercial, storage building (2002)	313 Lafayette Street	2002	None; not in CRIS
26		Italianate, commercial, 2-story, brick, ca. 1850 (Metzler Printing)	317 Lafayette Street	ca. 1850	None; not in CRIS
27		Commercial, 2-story, ca. 1947 (Dacobe)	319-325 Lafayette Street	1947	None; not in CRIS
28		Commercial, 2-story, early 20 th century (Fisher Auto Parts)	327-331 Lafayette Street	ca. 1907-1925	None; not in CRIS
29		Childs Building	333 Lafayette Street	1909	None; not in CRIS
30	06540.000554	Utica Heater (Central NY Supply)	418 Lafayette Street	1906	Undetermined
31		Mid-century church and hall (formerly St. George's Roman Catholic Church & John Bosco House)	425-429 Lafayette Street	1960s	None; not in CRIS
32		Concrete block garage, 1-story	431 Lafayette Street	ca. 1907-1950	None; not in CRIS

Appendix A. Annotated List of Properties

Property Name: Fulmer Building		USN:
Address: 300-306 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1915-1924	Style: Early 20 th c. Commercial	Stories: 2
Exterior siding: EIFS, brick	Roof: not visible	Plan: rectangular
Foundation: n/a	Sash: 1/1 DHS, fixed, display	Outbuildings: none

Alterations: EIFS on street frontages; all storefronts modified.

Physical Summary: Located on northwest corner of Columbia Street and Broadway. Building originally had four storefronts on Columbia Street and one on Broadway.

A 2-story, brick, two-part commercial block. Street frontages were refaced with EIFS (pre-2008). The Columbia Street façade (south) has a central, paired recessed entrance and a recessed entrance in the east bay of the west storefront. Storefront level windows include display and single fixed lights. The second floor of the south façade has four paired wood 1/1 DHS windows and corner windows. It has a parapet wall with corner pier accents and a stone name panel ("Fulmer") in the central gabled parapet. Original green & white ceramic tiles in storefront vestibule of one storefront. Identification of original stylistic details (i.e., storefronts, lintels with keystones, etc.) requires further research (historic photograph review).

First documented on 1925 Sanborn map. (Not in 1910 or 1913 city directories)

Facing northeast

Property Name: Early 20th c. commercial building, brick, 4-story (Utica Paint Co. Building)	USN: 06540.002010
--	--------------------------

Address: 301 Columbia Street	Current S/NRHP Status: Eligible; contributing resource to Downtown Genesee Street Historic District
-------------------------------------	--

Physical Summary:
301 Columbia Street was constructed in ca. 1900 (former Utica Paint Co.). It is a four-story brick commercial block of rectangular plan and with a flat roof, seven bays wide on Columbia Street and nine bays long on its Broadway face. The Columbia Street elevation is subdivided into three broad bays by pilasters; this treatment returns along part of the Broadway façade. The first-floor storefront was remodeled (c. 1970) and presently consists of large brick piers flanking a recessed entrance and display windows set within anodized aluminum panels. The upper floors have undivided double-hung sash with brick arched lintels with double keystones. Sills connect the windows and are interrupted by the pilasters. A stamped metal Neoclassical cornice with dentils extends along both street fronts of the building.

Facing southwest

Property Name: Neoclassical Revival commercial building, brick, 3-story (Teasers)		USN:
Address: 308-310 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1915-ca.1924	Style: Neoclassical Revival	Stories: 3
Exterior siding: brick, simulated stone	Roof: not visible	Plan: rectangular
Foundation: n/a	Sash: 1/1 DHS	Outbuildings: none
Alterations: Storefront modified, replacement windows		
Physical Summary: Located on north side of Columbia Street between Broadway and Sayres Alley. This block contains a row of four commercial buildings dating from the mid-19 th c. to early 20 th c.		
<p>The building is a 3-story, brick, two-part commercial block with Neoclassical Revival-inspired details on the upper stories. It has a single storefront with recessed entry and entrance to the upper floors in the west bay. The storefront was refaced with a simulated rubble stone exterior, now painted black. Stylistic details of the upper stories include: two-story corner pilasters; a single round arch window with keystone and tabs, one single and two tripartite windows openings with brick soldier course and keystone; stone lintels; entablature, and denticulated cornice. Identification of original storefront details requires further research (historic photograph review).</p> <p>First documented on 1925 Sanborn map.</p>		

Facing north

Property Name: Italianate (modified) commercial building, brick, 3 stories (formerly Morehouse Appliances)		USN:
Address: 312-316 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1850s; mid1930s; 1960s	Style: Italianate	Stories: 3
Exterior siding: brick, simulated stone	Roof: not visible	Plan: rectangular
Foundation: stone	Sash: 1/1 DHS	Outbuildings: none
Alterations: Storefront modified, replacement windows		
Physical Summary: Located on north side of Columbia Street between Broadway and Sayres Alley. This block contains a row of four commercial buildings dating from the mid-19 th c. to early 20 th .c.		
<p>The building is a detached 3-story, brick, two-part commercial block originally constructed in the Italianate style. The original 19th c.-era storefronts and entrance to the upper stories were modified into a single Art Deco storefront in the mid-1930s. At present, the storefront retains its mid-1930s central recessed entry. EIFS was applied to the storefront's large display windows and bulkheads sometime after August 2011; new storefront window openings were created at that time. Porcelain enamel panels remain over the storefront frieze and 2nd floor. They were removed from the 3rd floor, exposing the original façade and window openings. Italianate stylistic details include: segmental arched windows; hood moulds; and wood cornice with single wood brackets and dentil blocks. An Art Deco-style projecting neon sign is in fair condition ("ghost" letters for "Morehouse" on sign. The ca. 1930s sign panel above storefront is minimally visible intact beneath the porcelain enamel panels. It has a 1-story concrete block rear addition.</p>		
<p>A structure is documented at this general location on the 1858 map. Sanborn maps: 1884, vacant, "occupied by Museum at present" (#2401-2402 Columbia); 1888, fancy shop & music; 1899, tin shop & store; 1925 to 1986, store. Henry D. Morehouse established Morehouse Appliances in 1894 (identified on 1907 Century Atlas map). He was a tradesman with skills as a tinsmith and blacksmith. Morehouse expanded into stove pipe, and selling coal and wood burning stoves. In later years other products offered included ice boxes, manufactured gas-burning stoves, and gas & electric-powered wringer washers. Morehouse remained at its location on Columbia Street for nearly a century. The company relocated to New Hartford, NY, in 1991 (see Morehouse Appliances, https://www.morehousellc.com/about-us.html).</p>

Property Name: Early 20th C. Commercial Style (modified); 1-story, brick (Dataflow)		USN:
Address: 318-320 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1925	Style: Early 20 th c. commercial	Stories: 1
Exterior siding: EIFS, brick	Roof: gable	Plan: rectangular
Foundation: n/a	Sash: 1/1 DHS, fixed, display	Outbuildings: none
Alterations: EIFS on street frontages; all storefronts modified.		
Physical Summary: Located on north side of Columbia Street between Broadway and Sayres Alley. This block contains a row of four commercial buildings dating from the mid-19 th c. to early 20 th .c.		
<p>A detached, 1-story, early 20th-c Commercial Style building with original parapet brickwork detail intact. The original two storefronts (1950 Sanborn) were converted into a single store by 1970. The building was refaced with EIFS (pre-2008). The storefront has a recessed entrance in the east bay, and five window openings. A brick chimney is on the northwest corner of the roof. It has a rear one-story concrete block addition.</p>		
Sanborn maps: 1950, two stores; 1970 single store		
		
Facing northeast		

Property Name: Haberer Building		USN:
Address: 326-334 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1890s	Style: Romanesque Revival	Stories: 4
Exterior siding: brick	Roof: flat	Plan: rectangular
Foundation: n/a	Sash: 1/1 DHS, display	Outbuildings: none
Alterations: storefronts modified.		
Physical Summary: Located on the northwest corner of Columbia Street and Sayres Alley. An attached row building with the Jones Building on the west side. Building is presently vacant.		
<p>The building is a 4-story, brick, two-part commercial block constructed in the Romanesque Revival Style. The five-bay-wide south façade originally featured four storefronts with a central entrance to the upper floors. In the 1960s, the storefronts were modified and the two eastern storefronts were unified into a single storefront. Full-height brick pilasters divide the bays of the upper floors. The central bay has a single window openings and the storefront bays have paired windows that are round arch on the 2nd floor, segmental arched on the 3rd floor, and trabeated on the 4th. Decorative accents include sandstone sills, brick arch moulds, soldier course lintels, string courses, corbeled brick cornice, and name panel in the cornice of the central bay, "HABERER." The mid-20th c. glass and aluminum storefronts retain a few of their original materials and components such as display windows, angled front, and display boxes. Five single window openings punctuate each of the upper levels on the east side. The building is presently in poor-fair condition.</p>		
Possible architect: Frederick Hamilton Gouge		
Sanborn maps: 1899-1952, four stores; 1970 three stores.

Property Name: Kennedy Parking Garage (Broadway) and Mohawk Hospital Equipment, Inc. (Columbia Street)	USN: 06540.002007
---	--------------------------

Address: 301 Columbia Street	Current S/NRHP Status: Eligible; contributing resource to Downtown Genesee Street Historic District
-------------------------------------	--

Note: building identified at 608 Broadway in CRIS (National Register Nomination address). Current parcel data – 301 Columbia Street

Physical Summary: 608 Broadway and 335 Columbia Street were built during 1964-1970 as part of a larger urban renewal municipal complex. The Columbia Street elevation (identified as 335 Columbia Street) was to be the site of commercial storefronts (CRIS 2018). The original storefronts appear to remain intact, under panels which cover portions of the facade. This was the largest project attempted by Utica’s Urban Renewal Agency that was to rely on private investment as well. The attached flat-roofed poured concrete two-level parking garage (608 Broadway) is the base of a proposed hotel or office building begun under the auspices of Urban Renewal as part of Center City Mall, but never completed. Its banked site results in the first-floor level being partially buried under the adjacent Edward A. Hanna Park, at the south. The rectangular tower that was proposed to sit on the parking garage base was never completed, although its outline can be discerned in the column bases that pierce the roof.

Facing southeast

Property Name: Jones Building		USN:
Address: 336 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1890s	Style: Romanesque Revival	Stories: 4
Exterior siding: brick	Roof: flat	Plan: rectangular
Foundation: n/a	Sash: 1/1 DHS, display	Outbuildings: none
Alterations: storefront modified.		
Physical Summary: Located on the northwest corner of Columbia Street and Sayres Alley. An attached row building with the Haberer Building on the east side. Building is presently vacant.		
<p>The building is a 4-story, brick, two-part commercial block constructed in the Romanesque Revival Style. It has a single storefront (modified in mid-20th c.), which is presently in poor condition and mostly boarded up. The original entrance to the upper floors is in the west (not visible). Corbeled brick pilasters divide the three-bay-wide upper block. Each of the upper floors has three single windows with sandstone keystones. The 2nd floor roundhead window openings have brick arches with sandstone springers and decorative continuous brick lintel. Window openings on the 3rd and 4th floors are segmental and are presently have wood board infill. The roofline features a corbelled cornice and parapet with a sandstone name panel in the central bay, "JONES." It has a 1-story concrete block, rear addition.</p> <p>The building is in poor condition. Sections of the roof have collapsed and undermined the lower floors. Piles of building debris were noted on the first floor.</p> <p>Possible architect: Frederick Hamilton Gouge</p> <p>Sanborn maps: 1899, saloon; 1925-1986, single store.</p>

Property Name: Art Deco, 1-story commercial building (Berger's/ Norm Seakan TV & Appliances)		USN:
Address: 338-358 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: 1944	Style: Art Deco	Stories: 1
Exterior siding: brick, ceramic panels	Roof: flat	Plan: rectangular
Foundation: concrete	Sash: display	Outbuildings: none
Alterations: storefront modified.		
Physical Summary: Located on the north side of Columbia Street between Cornelia Street & Sayres Alley. An attached row building with 360-362 Columbia Street (part of former Berger's Department Store). Building is presently vacant.		
A 1-story, Art Deco-inspired commercial building with steel frame and concrete block curtain walls. The south façade has a World War II-era paneled storefront that is unified with the storefront at 360-362 Columbia Street to the west. The storefront has yellow brick bulkheads, a single entrance bay, ten display window bays covered with wood panels at present, and four light sconces. Some panels are missing from the parapet.		
Sanborn maps: 1950, Berger's Dept Store (built 1944); 1970-1986, NYS Manpower Training Center Utica Board of Education. The building was part of Berger's Department Store. Harris Berger founded the store on Whitesboro Street, later relocating it to Columbia Street. The Bergers assumed control of the company after their father's death in 1941. By 1950, the store had 150 employees and 25 departments. Berger's was one of downtown Utica's largest department stores, growing from a 450 sq ft store to 80,000 sq ft (<i>Utica Observer Dispatch</i> , "Berger's Has No Plans to Relocate," April 27, 1966).		

Facing northeast

338-358 Columbia Street, facing northwest

Property Name: Italianate and Art Deco commercial building, 3-story (Berger's Department Store)		USN:
Address: 338-358 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: late 19 th c., 1944	Style: Art Deco	Stories: 3; 2
Exterior siding: brick, ceramic panels	Roof: flat	Plan: rectangular
Foundation: n/a	Sash: display	Outbuildings: none

Alterations: storefront modified,

Physical Summary: Located on the northeast corner of Columbia & Cornelia streets. An attached row building with 338-358 Columbia Street (part of former Berger's Department Store). Building is presently vacant.

The original building was constructed as a 3.5-story Italianate-style commercial block with 2-story wing on north side. It has an Art Deco paneled storefront with 338-358 Columbia Street (Berger's Department Store; Linn Kinne architect, ca. 1930s). The original half-story and cornice were removed. The 2nd-story windows were filled in with block glass. Upper floors and rear block were refaced with EIFS (pre-2008). Window openings in end bays of 3rd floor south facade removed/covered. Storefront windows boarded up.

Brick building at location on 1893 and 1907 maps.

Sanborn maps: 1899, 3.5-story, saloon; 1925, 3.5-story, single store; 1950, Berger's Dept Store (built 1944); 1970-1986, NYS Manpower Training Center Utica Board of Education. The building was part of Berger's Department Store. Harris Berger founded the store on Whitesboro Street, later relocating it to Columbia Street. The Bergers assumed control of the company after their father's death in 1941. By the 1950, the store had 150 employees and 25 departments. Berger's was one of downtown Utica's largest department stores, growing from a 450 sq ft store to 80,000 sq ft (*Utica Observer Dispatch*, "Berger's Has No Plans to Relocate," April 27, 1966)

Property Name: Columbia Place	USN: 6540.002011
Address: 401 Columbia St	Current S/NRHP Status: Eligible; contributing resource to Downtown Genesee Street Historic District
<p>Physical Summary: <u>401 Columbia Street</u> was built in ca. 1900 (c. 1910; c. 1920; early 21st-c. alterations). It is a four-story brick commercial block, of rectangular plan with a flat roof. The Columbia Street elevation is divided into six bays, each having paired sash set between brick pilasters. This treatment extends, in modified form, along three bays of the Cornelia Street elevation. The pilasters are faced with stone at the first-floor level, below a narrow-bracketed entablature with cornice. Between the first floor pilasters, original storefronts have been infilled with brick and fixed sash windows. The majority of the upper-story windows in the building was replaced with smaller metal-frame sash, or at present boarded over; however, the original openings are visible and restorable. Windows have simple metal lintels and stone sills. An entablature, consisting of a stone architrave with large dentils, a brick frieze and a modillioned cornice, extends along the full length of both street elevations. The west half of the building constitutes an early addition and replicates all of the details found in the earlier portion of the building. A three-bay wide addition constructed at the south end of the building c. 1920 also replicates the detailing of the c. 1900 portion of the building.</p>

Property Name: Early 20th c., mixed-use, 3-story (500 Columbia Street, LLC)		USN:
Address: 500-504 Columbia Street	S/NRHP Status: None; not in CRIS	
Date: ca. 1910s	Style: early 20 th c. commercial	Stories: 3
Exterior siding: brick	Roof: flat	Plan: rectangular
Foundation: n/a	Sash: display, 3/3 DHS, and replacement DHS	Outbuildings: none

Alterations: storefront, 1-story addition (ca. late 20th c.)

Physical Summary: Located on the northwest corner of Columbia and State streets.

A 3-story, brick mixed use building. It was originally constructed with three storefronts. The largest storefront has a canted corner entrance with single column. The corner storefront and the west storefront were modified in the ca. late 20th c. and refaced with wood panel sidings with new fixed widows; the transom remains intact. The east side has a single storefront with large display window and a single door entrance to the upper levels. Brick pilasters divide the storefront bays. The original continuous 1 storefront cornice is intact. The upper floors have three 2-story polygonal oriels with brackets and a continuous cornice with single decorative brackets. Upper floor windows on the east side are single and paired, segmental arch (2nd fl) and flat (3rd fl.) with stone lintels. A 1-story restaurant addition is on the west side.

Not on 1907 Century Atlas Map.

Sanborn maps: Not on 1899; 1925, printing store; 1950 two restaurants & one store; 1970-1986, restaurant

Property Name: Former Interurban Trolley Garage		USN: 06540.000101
Address: 300-306 Lafayette Street	Current S/NRHP Status: Undetermined	
Date: 1908	Style: Early 20 th c. commercial	Stories: 2
Exterior siding: brick with EIFS	Roof: flat, gable	Plan: rectangular
Foundation: concrete	Sash: 1/1 DHS	Outbuildings: none
Alterations: office windows filled in on 1st floor and entrance altered (pre- 2008). Refaced with EIFS by 2011		
Physical Summary: Located on southwest corner of Lafayette Street and Broadway. All buildings to the west and north were demolished. The north side of the parcel has a perimeter fence. Stone pavers are exposed along the east side of the building.		
<p>The building was originally constructed as an interurban trolley garage. It consist of a 2-story, brick block, fronting Lafayette Street which contains the office and four garage bay openings and a rear, 1-story brick garage wing perpendicular to the main block with three gabled roofs skylights and parapets with clay tile coping at the north end. Office in southeast corner of the building. Window openings have stone sills; original lintels are not visible. Three garage bay doors and transoms on the south side were refaced with EIFS and no longer functional. The corbelled cornice and brick frieze panels are covered with EIFS. A 1-story, brick garage bay wing with flat roof is on the west side. The east side of the rear block has three filled-in bays, a single entrance door, garage bay and roll door with 8 wood panels & 12 lights, and overhanging eaves with wooden knee brackets. A 1-story concrete block addition is attached to the north side of the Broadway frontage. The north side has a single garage bay and a paired garage bays doors. The building has wooden trusses on steel columns and girders, and concrete floor.</p> <p>Not on 1907 Century Map.</p> <p>Sanborn maps: 1925, Trolley Express Station-NY State Railways; 1950, Utica Transit Corp-Lafayette St Garage (capacity 37 buses); 1970-1986, Auto Service Station.</p>

Alterations:		
Physical Summary: Located on the east side of the commercial complex at 303-309 Lafayette Street (Clemente Novelties Inc.).		

Facing southeast

Property Name: Italianate, commercial, 2 story, brick (Metzler Printing)		USN:
Address: 317 Lafayette Street	Current S/NRHP Status: None; not in CRIS	
Date: ca. 1850	Style: early 20 th c. Commercial	Stories: 2
Exterior siding: brick	Roof: flat	Plan: rectangular
Foundation: stone	Sash: replacement	Outbuildings: none
Alterations: roof, window openings filled in w/ brick, entrance		
Physical Summary: Located on south side of Lafayette Street, on the west side of Sayres Alley.		
<p>A 2-story, brick Italianate building originally constructed as a residence and converted for commercial use. The north façade of the main block is three-bays wide with an altered side-hall entrance and concrete replacement stoop in the east bay; two basement windows with stone lintels; 1st floor windows have brick soldier course lintels; and 2nd floor windows are filled in with wood panels and feature hood molds. The building has wide-overhanging eaves with paired scroll-cut brackets. Window openings on the side elevations have stone sills and brick soldier course lintels. On the east side two 1st floor window openings and two basement windows are filled in with brick, one 1st floor window opening is partially filled in with brick, and one basement window is covered by a wood panel. The west side has two window openings. The building is depicted on historic maps with a frame rear addition which was later replaced with a two-story, brick commercial block with tile brick faced walls. Original industrial-type window sash on the rear block was replaced. The 1st floor on the east side has two single door entrances, one double leaf door entrance (all doors are metal); and five window openings. Five window openings are on the 2nd floor of the east side. The two-bay wide south façade has four window openings.</p> <p>A structure is depicted at this location on the 1852 & 1858 maps. Associated with E. Miellam (sp?) on 1883 map.</p> <p>Sanborn maps: 1884 & 1888, dwelling w/ 1.5 story rear addition (#675 Fayette); 1925-1986, printing office & two story printing factory</p>

Property Name: Childs Building (Charles H. Childs & Co. Building)		USN:
Address: 333 Lafayette Street	Current S/NRHP Status: None; not in CRIS	
Date: ca. 1909	Style:	Stories: 4
Exterior siding: brick, EIFS	Roof: flat	Plan: rectangular
Foundation: stone	Sash: replacement	Outbuildings: none

Alterations: north façade-refaced with EIFS, storefront

Physical Summary: Located on southeast corner of Lafayette and Cornelia streets.

A 4-story, brick, two-part commercial block with two street frontages. The north façade has a modified storefront with EIFS exterior, recessed central entry, replacement entranceway, and new window openings. Storefront extends to the west side and has a single window opening. All window openings on the upper floors of the building are covered at present; unknown if original sash is intact. The upper part of the north façade is three bays wide and features paired windows with continuous lintels and sills divided by 3-story brick pilasters. A stone name panel, "CHILDS," is located on the spandrel of the central bay on the 4th floor. The building retains its original cornice and dentil blocks. The first floor of the west side has seven single window openings that are filled in with brick, a single entrance, and a storefront covered with wood panels (unknown if display window & entrance are intact). The upper portion of the west side has symmetrical fenestration; twenty single window openings per floor with stone sills and alternating brick and stone lintels (1st floor has same treatment). A steel fire escape is attached to the west side. The roof has a stairway/elevator bulkhead and a single interior brick chimney.

Sanborn maps: 1899, 2-story dwelling on the site (demolished); 1925, Dairymen's League Cooperative Association Inc. Warehouse, Auto Sales & Service Station on 1st floor; 1950, part of Berger's Department Store complex, 1970-1986, Berger's complex identified as NYS Manpower Training Center-Utica Board of Education. See "Hidden History: The Buckmobile," <http://www.cnyhomepage.com/news/hidden-history-the-buckmobile/795267865>.

The building was constructed by C.H. Childs Company, which sold carriages, bicycles, and vehicle chassis. Built as a factory and showroom, the Childs Building is historically associated with the commercial development history of downtown Utica. During the late 19th c., then known as the J.M. Childs Company, the company had a factory down the street on the northwest corner of Lafayette and Seneca streets (Utica Hotel site [see 1883 Hopkins map]). At that location, the company produced farm tools, wagons, carriages, bicycles, and automotive coachwork for over 60 years.

Property Name: Utica Heater (Central NY Supply)		USN: 06540.000554 / 06540.001553
Address: 418 Lafayette Street	Current S/NRHP Status: Undetermined/ Not Eligible	
Date: ca. 1906	Style: industrial, vernacular	Stories: 2
Exterior siding: brick	Roof: flat, shed	Plan: L-shape
Foundation: stone	Sash: 8/8, 1/1 DHS, display	Outbuildings: none
Alterations: north façade-refaced with EIFS, storefront		
Physical Summary: Located on northwest corner of Lafayette Street and Carton Avenue. The Erie Canal was located immediately the north of the building (Oriskany Street West). Undeveloped lots are on the south and west side of the property.		
<p>The building consists of a 2-story, brick, two-part commercial block with modified storefront and an attached L-shaped building that housed a former garage and mattress factory. The storefront was modified in ca. late 20 c. It has an entrance in the west bay, simulated stone facing, and replacement display windows. The east side of the commercial block has five segmental window openings with stone sills, four of with are covered with wood panels. A narrow 2-story bay with shed roof connects the two buildings.</p> <p>The Carton Avenue façade (north): 11-bays wide and divided by brick pilasters. It has symmetrical fenestration; all window openings on the north side have stone sill and brick soldier course lintels. First floor has three segmental arch bays with replacement doors and seven window openings (filled in with wood panel at present). Second floor has nine single windows with 8/8 DHS and two bays with replacement door. The north side of the building has a painted wall sign on the 2nd floor spandrel for "Central NY Supply Co. Inc." and another wall sign consists of painted letters arranged vertically on the brick pilasters in the following sequence for "Gross – Bedding – Co.- Mattresses." The west side of the Carton Avenue block has six bays and similar arrangement and type of fenestration. A single entrance door is on the west side. The east side of the Carton Avenue block is twelve bays long with similar arrangement and type of fenestration. All windows covered with wood panel, except for one on the 2nd floor). A single bay door is on the east side. The south side of the Carton Avenue block is nine-bays wide and has similar fenestration as the north side. It has a modern entrance with metal and glass double leaf doors.</p> <p>1883 Hopkins Map: two buildings on the property, owned by Mrs. Pond; 1884 & 1899 Sanborn map: Cole's Hotel (demolished); 1907 Century Map: extant building first documented, brick office building & brick building fronting Carton Avenue (bldgs. Detached at that time), Utica Heater Company on the north side of Carton Avenue; 2920 City Directory, Utica Heater Co. located at 92 Lafayette Street; 1925 Sanborn, store fronting Lafayette and Tailor Made Underwear & Mattress Factory (Gross Mattress Company) on current parcel; 1950-1986, Plumbing supplies. (Note, the 1978 NYS OPRHP Inventory Form incorrectly identified the hotel depicted on the 1899 Sanborn Map as the current building fronting Lafayette Street; the hotel was demolished and its location is not on the parcel associated with #418 Lafayette Street.</p>

Re: DOH
Proposed Utica Hospital
Utica, Oneida County, NY
16PR06600

Dear Mr. Eckler:

Thank you for requesting the comments of the New York State Historic Preservation Office (OPRHP). We have reviewed the provided documentation in accordance with Section 106 of the National Historic Preservation Act of 1966. These comments are those of the OPRHP and relate only to Historic/Cultural resources. They do not include other environmental impacts to New York State Parkland that may be involved in or near your project. Such impacts must be considered as part of the environmental review of the project pursuant to the National Environmental Policy Act and/or the State Environmental Quality Review Act (New York Environmental Conservation Law Article 8).

Based on available information, your project is located in an archaeologically sensitive area. Because of the size of the proposed project, the hypothesized intersection of the Erie and Chenango Canals within your project area, the presence of a previously identified archaeological site (06540.001655), and the potential for cultural resource deposits to be intact within the subject parcels, OPRHP recommends that a Phase IA Archaeological Survey is warranted for all portions of the project that will involve ground disturbance. A Phase IA survey is a literature search and sensitivity study, designed to systematically assess the significance of, and overall sensitivity for cultural resources within your project area's Area of Potential Effect (APE). This study will subsequently be used to make recommendations regarding whether or not any further, subsurface investigations are warranted.

If you consider portions of the project area to be disturbed, documentation of the disturbance will need to be reviewed by OPRHP. Examples of disturbance include mining activities and multiple episodes of building construction and demolition. Documentation of ground disturbance should include a description of the disturbance with confirming evidence. Confirmation can include current photographs and/or older photographs of the project area which illustrate the disturbance (approximately keyed to a project area map), past maps or site plans that

Page 2.

accurately record previous disturbances, or current soil borings that verify past disruptions to the land. It should also be noted that the previous demolition of historic buildings does not negate the presence of Historic or even Precontact archaeological sites in the yards of these now absent structures.

The OPRHP can provide standards for conducting cultural resource investigations upon request. Cultural resource surveys and survey reports that meet these standards will be accepted and approved by the OPRHP.

Our office does not conduct cultural resources surveys. A 36 CFR 61 qualified archaeologist should be retained to undertake the Phase I survey. Many archaeological consulting firms advertise their availability in the yellow pages. The services of qualified archaeologists can also be obtained by contacting local, regional, or statewide professional archaeological organizations. Archaeology surveys can be expected to vary in cost per mile of right-of-way or by the number of acres impacted. We encourage you to contact a number of consulting firms and compare examples of each firm's work to obtain the best product.

Please also be aware that a Section 233 permit from the New York State Education Department (SED) may be necessary before any archaeological survey activities are conducted on State-owned land. If any portion of the project includes the lands of New York State you should contact the SED before initiating survey activities. The SED contact is Michael Lucas and he can be reached at (518) 486-2015. Section 233 permits are not required for projects on private land.

If further correspondence is required regarding this project, please refer to the project number (PR) noted above. If you have any questions, I can be reached at 518-268-2218 or via email at Josalyn.Ferguson@parks.ny.gov.

Sincerely,

Josalyn Ferguson (B.A., M.A.)
Historic Preservation Specialist/Archaeology

Re: DOH
Proposed Utica Hospital/Mohawk Valley Health Systems
Utica, Oneida County, NY
16PR06600

Dear Mr. Eckler:

Thank you for requesting the comments of the Division for Historic Preservation of the Office of Parks, Recreation and Historic Preservation (OPRHP). We have reviewed the report prepared by Panamerican Consultants, Inc. entitled "Phase IA Archaeological Investigation for the Proposed Mohawk Valley Health System Utica Hospital, City of Utica, Oneida County, New York" (Hanley et al. April 2016), in accordance with the New York State Historic Preservation Act of 1980 (section 14.09 of the New York Parks, Recreation and Historic Preservation Law). These comments are those of the Division for Historic Preservation and relate only to Historic/Cultural resources. They do not include potential environmental impacts to New York State Parkland that may be involved in or near your project. Such impacts must be considered as part of the environmental review of the project pursuant to the State Environmental Quality Review Act (New York Environmental Conservation Law Article 8) and its implementing regulations (6NYCRR Part 617).

Based upon information available to our office and the review of the above-mentioned report, the OPRHP offers the following recommendations:

1. We concur with the recommendation that the 442 Lafayette Street Historic Site (USN 06540.001655/NYSM 12153) be subject to a Phase II Site Examination.
2. We further recommend Phase IB subsurface testing be conducted in relation to the following:
 - a. Due to the potential of sections of the Chenango Canal and associated Huntington Basin remaining intact within the project's Area of Potential Effect (APE) (possibly deeply), we recommend testing within the following parcel addresses:
 - i. *Chenango Canal*: 318-333 Oriskany St., 402 Oriskany St., 514-524 Lafayette St., 506 Columbia St., and depending on the degree of disturbance related to recent arterial construction, possibly 509 Lafayette St.;

...2

Mr. Steve Eckler

Division for Historic Preservation

June 18, 2018

Page 2.

- ii. *Huntington Basin*: 401 & 402 State St., and the section of State Street between these addresses;
 - b. 437 Lafayette Street;
 - c. 458 Columbia Street;
 - d. Witzemberer Building, 460-464 State Street;
 - e. 450-454 State Street. A foundation associated with a structure on this property was previously partially exposed during some sidewalk related impacts.

The OPRHP welcomes the opportunity to discuss the proposed archaeological investigations prior to fieldwork with the appropriate cultural resource firm, and provide additional information about our concerns for potential archaeological resources at these locations.

Finally, please verify all state and/or federal agencies involved in this project, from which permits, permissions and/or funding are being sought, and provide the OPRHP with the appropriate contact names and addresses, including email, for each involved agency.

If further correspondence is required regarding this project, please refer to the project number (PR) noted above. If you have any questions, I can be reached at 518-268-2218 or via email at Josalyn.Ferguson@parks.ny.gov.

Sincerely,

Josalyn Ferguson (B.A., M.A.)

Re: DOH/DEC/SEQRA
Proposed Utica Hospital/Mohawk Valley Health Systems/New Construction
Columbia St., Oriskany St. W., State St. and Broadway (vic), Utica, Oneida County
16PR06600

Dear Mr. Eckler:

Thank you for your ongoing consultation with the Division for Historic Preservation regarding this undertaking. We continue to review the project in accordance with the New York State Historic Preservation Act of 1980 (Section 14.09 of the New York Parks, Recreation and Historic Preservation Law). These comments are those of the OPRHP and relate only to Historic/ Archaeological resources.

Most recently we have received and reviewed the Phase IA Architectural Inventory Report prepared by Panamerican Consultants (May 2018). Based upon this review, we have determined that your project area includes a portion of the Downtown Genesee Street Historic District, which is listed in the New York State and National Registers of Historic Places. The project area also includes 10 other buildings, which have been found by this office to be eligible for inclusion in the registers. A full list of the identified resources is appended to this letter.

At this time, we are also evaluating information that is being provided from the ongoing archaeological investigations at the project area. Additional comments regarding potential impacts to archaeological sites will be provided once all archaeological investigations are completed.

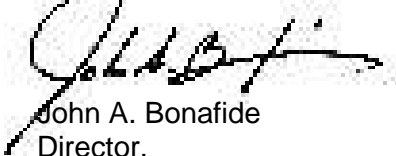

In reviewing the recently submitted project materials, it appears that at least 2 contributing buildings within the listed historic district and 10 eligible historic resources may be demolished as part of this undertaking. Based on these proposed demolitions we have determined that the project as designed will have an Adverse Impact on historic resource as defined in 9 NYCRR Part 428.7(a)(b)(c).

As a result of this determination, we would request that the project sponsor undertake an assessment of alternatives that might avoid or lessen the adverse impacts associated with the proposed demolition of historic buildings. This assessment should include an exploration of alternatives that might:

- Save in place and adaptively repurpose some of the historic structures.
- Relocate one or more key buildings out of the project area for adaptive reuse.

If you should have any questions regarding my comments, I can be reached at (518) 268-2166 or john.bonafide@parks.ny.gov.

Sincerely,

A handwritten signature in black ink, appearing to read "John A. Bonafide". The signature is written in a cursive style with a long horizontal stroke extending to the right.

List of Historic Resources

SHPO USN	Address	Property Name	Determination of Eligibility
06540.002010	301 Columbia Street NR Listed in the Downtown Genesee Street Historic District	Brick Commercial	Date of construction: c. 1900; storefront remodeled c. 1970. Description: A four-story brick commercial block of rectangular plan and with a flat roof, seven bays wide on Columbia Street and nine bays long on its Broadway face. The Columbia Street elevation is subdivided into three broad bays by pilasters; this treatment returns along part of the Broadway façade. The first-floor storefront was remodeled (c. 1970) and presently consists of large brick piers flanking a recessed entrance and display windows set within anodized aluminum panels. The upper floors have undivided double-hung sash with brick arched lintels with double keystones. Sills connect the windows and are interrupted by the pilasters. A stamped metal neoclassical cornice with dentils extends along both street fronts of the building. History: In 1907 this structure was occupied by A. W. Blackburn.
06540.002095	326-334 Columbia Street	Haberer Building	The Haberer Building is eligible for the State and National Registers of Historic Places under Criterion A as examples of the continuing commercial development of the city of Utica at the end of the nineteenth century. They are also eligible under Criterion C, Architecture, as examples of late-nineteenth-century large Romanesque Revival commercial buildings at the western edge of the city's commercial district. The Haberer Building was constructed with four commercial storefronts with a center entrance and three stories of non-commercial uses above. It is attributed to Utica architect Frederick Hamilton Gouge, who was born in 1845 in rural Oneida County. Gouge received a bachelor of arts degree from Hamilton College in 1870 and spent one year working in civil engineering before joining William H. Miller, an architect in Ithaca, New York. He moved to Utica in 1876 and established his architecture practice there and remained in Utica until his death in 1927. The building is constructed in the Romanesque Revival style executed in brick, and is four stories in height. The façade is divided into five bays separated by three-story brick pilasters. The center bay has a single window with a stone lintel on the second story, a brick-arched window on the third, and a flat-arched window with brick voussiors on the fourth. Above that is a slightly raised parapet that may have lost brick finials at the tops of the pilasters. Symmetrical bays of paired windows flank the center with round-arched windows on the second story, segmentally-arched windows with brick voussiors on the third, and flat-arched windows with brick voussiors on the fourth. Above the fourth-story windows is corbelled brick in each of the bays. The storefronts have been altered but the remainder of the façade is substantially intact. The eastern elevation has no opening on the first story but five windows on each of the upper stories. Although deteriorated, the building retains integrity of design, materials, and craftsmanship. Sources: 1. Henry J. Cookinham (1912). History of Oneida County, New York: From 1700 to the present time of some of its prominent men and pioneers. The S. J. Clarke Publishing Company. 2. Daniel E. Wager (1896). "Oneida County, New York Biographies From Our County and Its People, Part III: Family Sketches". The Boston Historical Company. p. 136.
06540.002096	336 Columbia Street	Jones Building	The Jones Building was constructed as a three-bay mixed-use building with one commercial storefront and three stories of non-commercial uses above in a style similar to the Haberer Building. Although there is no information about commercial tenants, it also was constructed in the Romanesque Revival style executed in brick, and is four stories in height. The façade is divided into three bays with a single window in each bay. The second story has round-arched windows connected by terra cotta decoration and stone keystones; third and fourth-story windows have segmental arches with stone keystones and in the center bay of the top story is a corbelled brick frame. Within that frame is a stone panel with the lettering "JONES", and a slightly raised parapet wall with brick corbelling that matches the remainder of the parapet. The first-story storefront is currently boarded up but appears to contain few if any historic features. Although deteriorated, the building retains integrity of design, materials and craftsmanship. Sources: 1. Henry J. Cookinham (1912). History of Oneida County, New York: From 1700 to the present time of some of its prominent men and pioneers. The S. J. Clarke Publishing Company. 2. Daniel E. Wager (1896). "Oneida County, New York Biographies From Our County and Its People, Part III: Family Sketches". The Boston Historical Company. p. 136.
06540.002011	401 Columbia Street NR Listed in the Downtown Genesee Street Historic District	Brick Commercial	Date of construction: c. 1900; c. 1910; c. 1920; early 21st century alterations. Description: A four story brick commercial block, of rectangular plan with a flat roof. The Columbia Street elevation is divided into six bays, each having paired sash set between brick pilasters. This treatment extends, in modified form, along three bays of the Cornelia Street elevation. The pilasters are faced with stone at the first-floor level, below a narrow-bracketed entablature with cornice. Between the first floor pilasters, original storefronts have been infilled with brick and fixed sash windows. The majority of the upper-story windows in the building have been replaced with smaller metal-frame sash, or are boarded over; however, the original openings are visible and restorable. Windows have simple metal lintels and stone sills. An entablature, consisting of a stone architrave with large dentils, a brick frieze and a modillioned cornice, extends along the full length of both street elevations. The west half of the building constitutes an early addition and replicates all of the details found in the earlier portion of the building. A three-bay wide addition constructed at the south end of the building c. 1920 also replicates the detailing of the c. 1900 portion of the building.
06540.002107	460-464 Columbia Street	Witzenberger Building	The Witzenberger Building is eligible for the State and National Registers of Historic Places under Criterion C, Architecture, as an example of a late-nineteenth-century brick commercial/residential building that retains its upper stories and the basic layout of the first-story storefront configuration with the center door providing access to the residential floors above. This 3.5-story brick two-part commercial mixed-use building has two storefronts and a center entrance to the upper stories. The south façade is divided into three bays, with a glass-block window in the center bay (above the center entrance door) and three windows in the flanking symmetrical bays. The first story bay divisions are marked by rusticated stone blocks and modified storefronts. Second-story windows have segmentally-arched windows with brick voussiors and stone sills. Third-story windows have stone lintels and sills, above which is a corbelled brick cornice with a name panel spelling "WITZENBERGER" above the center bay. The top story has a gabled parapet with a square window and flanking that, above the wider bays, are single dormers punctuating a mansard roof. The west wall is blank where an earlier building stood, and the rear wall has three brick stories with a mix of windows and doors in each half of the building. Four tall chimneys puncture the roofline. Above the first story, the building retains a high degree of architectural integrity.
06540.000101	300 Lafayette Street	Former Utica & Mohawk Valley Railway Car Barn/Electric Express/Girard Chevrolet Service Garage	The former Utica & Mohawk Valley Railway car barn at 300-306 Lafayette Street in Utica, Oneida County, is eligible for the State and National Registers of Historic Places under Criterion A, Transportation, for its connection with the history of electric transit in the western Mohawk Valley. Built in 1908, it is also eligible under Criterion C, Architecture, as an example of a building type specifically designed to house both the offices of the transit company and for the storage of electric trolley cars. It served as a trolley barn from 1908 until the end of electric streetcar service in Utica in 1941 and as a bus garage until some time in the 1950s. Fixed-rail transportation in Utica began around the time of the Civil War, and in 1886, the Utica Belt Line Company was organized to obtain control of all street railroads in Utica. Electricity was substituted for horse cars before the turn of the twentieth century, and in 1901, all city and suburban streetcar lines serving Utica were unified into the Utica and Mohawk Valley Railway. In 1907, the Rome City Street Railway was acquired and a double-track interurban line was completed between Rome and Little Falls to the east, by way of Utica. In 1912, the Utica & Mohawk Valley Railway and the Oneida Railway merged with New York State Railways with its headquarters in Utica. At its peak, the Utica lines operated 17 routes with more than 100 cars, but in 1941, all electric lines in Utica ceased operations and were replaced with gas-powered buses. In 1948, the Utica Transit Corporation was organized and used this building as a bus garage for several years after that. It later became an auto repair garage. The brick building is comprised of two major components: at the street corner is a small two-story office building with four windows on the Lafayette Street side on the second story only and three windows on the Broadway elevation on both stories. There are undecorated corner pilasters and between them is a corbelled brick cornice and brick paneled parapet wall, now partly covered.

			<p>300 Lafayette St. Continued</p> <p>The first story of the Lafayette Street elevation was altered, probably around the time the building ceased to serve its original function. First-floor windows on the Lafayette Street elevation were eliminated but their historic voussoirs were left in place; second story windows remain intact. On the Broadway elevation, first-floor windows have been infilled, but their openings remain; on the second floor, windows remain intact. The brick pilasters serve to visually separate the office function from the garage function on both Lafayette and Broadway elevations. West of the corner office along Lafayette Street is a colossal one-story garage with pilasters dividing the long Lafayette Street elevation into sections: the section closest to the office is approximately the same width, as is the western section, but the western section has been divided in half by another pilaster. Garage opening heights have been changed, but the original rhythm of the openings and façade divisions has not. At the far west is a one-story garage visible on the Sanborn Insurance Map of 1950. Hidden behind the tall parapet wall of the Lafayette Street elevation are three gabled roofs set adjacent to each other. This wing is only visible on the Broadway side where a wide bracketed overhang runs the length of this wing along the street. There are three large windows along the Broadway elevation and garage doors on the north (rear). The brick gables are terminated with heavy terra cotta parapet caps. The roof appears to have once contained skylights that have since been roofed over. The original post-and-beam construction of the open garage area remained intact as late as the 1970s. Despite exterior alteration, 300-306 Lafayette may be the only remaining building in Utica that illustrates the history of electrical street railway service in the city.</p>	The
06540.02114	333 Lafayette Street	Childs Building	<p>Childs Building (Charles H. Childs & Co. Building) 333 Lafayette St 1909 The Childs Building is eligible for the State and National Registers of Historic Places under Criterion A as an example of the continuing industrial development of the city of Utica into the twentieth century. It is also eligible under Criterion C, Architecture, as an example of an early-twentieth-century large masonry industrial/commercial building. The building was constructed in 1909 by the C.H. Childs Company, which sold carriages, bicycles, and vehicle chassis. Built as a factory and showroom, the company had a factory nearby before this building was constructed and once produced farm tools, wagons, carriages, bicycles, and automotive coachwork at the earlier location for over 60 years. The building is a four-story brick two-part commercial/industrial block with frontages on two streets. The north façade has a modified storefront with a non-historic exterior wall cladding system. There is a recessed central replacement entry and new window openings and wraps the first bay of the west side. All upper story windows are boarded up except for a few on the second story, so it is not known whether historic window sash exist. A stone panel with the name "CHILDS" is placed above the third story windows. All windows are trimmed with cast stone lintels and sills on the north elevation. Contrasting stone and brick voussoirs cap windows on the twelve bays of the west elevation and the eight bays of a matching extension marked by a vertical separation in the brick. The extension has a secondary cornice above the first story and brick piers relating to the upper-story bay division. The openings in this elevation are covered with vertical non-historic material.</p>	
06540.002119	437 Lafayette Street		<p>437 Lafayette Street in Utica, Oneida County, is eligible for the State and National Registers under Criterion C, architecture, as a substantially intact Italianate style residence from the middle of the nineteenth century. It is located in an area just west of downtown Utica near the site of the junction of the former Erie and Chenango Canals, which brought unprecedented prosperity to Utica, causing a boom in both industrial and residential development in the city. Once one of the most common residential building types in Utica, today this is the only remaining Italianate residential building in the immediate vicinity. The brick building is two-and-one-half stories tall on a low stone basement. The façade is divided into two bays with a double-door entry in the west bay with pilasters supporting a bracketed hood and a three-sided bay window in the east bay with brick segmentally arched windows with keystones. Above the second story are flat-headed windows situated immediately beneath the wood bracketed cornice. The wood bracketed cornice continues along the east elevation of the main block and behind that is a lower two-story block that does not include the half-story at the front. Window configurations are the same as on the front except that the brick arches do not include keystones. A large industrial building that appears to be an older brick structure with a modern sheet-metal front borders the building on the east. The west elevation is similar to the east except for the presence of a porch (partially altered) where the main block intersects the rear. There is a detached 2-story, 2-bay-wide outbuilding (carriage house) with double-leaf wood panel (3) and glass (8 lights) doors, hay door, and corrugated metal exterior siding on the southwest corner of the property. Despite its deterioration, the building retains a high degree of architectural integrity.</p>	
06540.001489	440 Lafayette Street	L. Snyder House	<p>The adjacent brick buildings at 440, 442 and 444 Lafayette Street are eligible for the National Register of Historic Places under Criterion C, Architecture, as rare survivors of canal-era residential buildings from the earliest period of Utica's development along the Erie Canal and the lateral Chenango Canal. The three simple Greek Revival-inspired buildings are situated just a short distance east of the Chenango Canal (now covered by the arterial highway of NY Routes 5, 8 and 12) and one block south of Oriskany Street, the former location of the Erie Canal. The Chenango Canal opened in 1837 and connected the Erie Canal one block northwest of this location with the Susquehanna River at Binghamton, nearly 100 miles to the south. The canals ushered in a period of great prosperity in Utica that saw significant residential, commercial and industrial development adjacent to the canals. They are surviving residential buildings in a neighborhood that later evolved to become the western edge of the central business district of Utica. Industrial buildings were located along both the Erie and Chenango canals north and west of this former residential district and later scattered along Lafayette, Columbia, and perpendicular streets. A railroad was constructed near the canal and this eventually replaced the canal as the major transportation route to the south after it closed in 1878. Maps made between the middle of the nineteenth century and into the 1950s illustrate the gradual replacement of residential buildings by industrial buildings as well as the installation of commercial uses in the first stories of some former residences. After the 1950s, large areas in the neighborhood were stripped of buildings altogether, leaving the area with large open spaces between buildings of all types. In addition, in some cases, modern infill has replaced earlier buildings. 444 Lafayette is similar in age, materials and scale to its neighbors at 440 and 442 but is a two-story flat-roofed building with three bays, a high stone basement but an altered doorway and surround. A simple brick frieze cornice with brick dentils and a wood overhang remain. Window openings are filled with non-historic 1/1 sash.</p>	
06540.001490	442 Lafayette Street	S. Isele House		
06540.001491	444 Lafayette Street	C & A Eichmeyer House		

06540.001555	509 Lafayette Street	Utica Turn Hall/Utica Turnverein	<p>The former Turnverein Hall is eligible for the National and State Registers of Historic Places under Criterion A, Social History, for its association with the history of German immigration to Utica in the second half of the nineteenth century. It is also eligible under Criterion C, Architecture, as a rare example of the rundbogenstil (German Romanesque) in Utica. It was built in 1894 by the German-American community as a gymnasium and social hall. "The Turnverein movement was the most important secular organization in German immigrant communities in the United States. It was founded by Friedrich Ludwig Jahn and involved a systematic approach to gymnastics intended to prepare Germans physically and mentally to combat the conquering French. The Turnplatz, or gymnastic field, included places for long jumping, high jumping, pole vaulting, as well as gymnastic equipment such as the balance beam, horse, ladders and parallel bars. The Utica Turnverein was established in 1854 and Turner societies in New York State formed the Amerikanischer Turnerbund, or American Gymnastic Union in the 1860s. The Utica Turnverein was formally reorganized in 1882 and in 1894 the membership constructed this Turn-Halle. These clubs built spacious halls that functioned as centers of nineteenth-century community life, housing gymnasiums, bowling alleys, ballrooms, theaters, and saloons. Most Turnvereins also had benevolent, intellectual, and social goals, including caring for the needy, establishing schools, and providing entertainment. Turner societies were proponents [of] German language instruction and physical education in public schools as well as function as German-American social clubs." Source: DOT Survey (PIN 2134.41), NY 5/8/12 arterial, 2008. This building served the as Utica Turnverein until 1922, and by 1925, it was being used as an auto and truck body shop. The brick building is a one-and-one-half-story, front-gabled building originally used as a gymnasium. It rests on a cut stone foundation and the roof is asphalt. The rundbogenstil became popular in Germany in the second quarter of the nineteenth century and in the middle of the nineteenth century in the United States, likely for its historical associations. The gable end (north) has a tri-partite window located above the central double doors which are flanked by two small round windows. The east façade has five large windows in bays marked by brick pilasters. A modern brick warehouse has been added to the west and south sides of the building.</p>

Re: Downtown Genesee Street Historic District
401-407 Columbia St
Utica NY 13502
Oneida County

Dear Sir/Madam:

I am pleased to inform you that the above referenced property was listed August 24, 2018 on the National Register of Historic Places. As you may know, the National Register is the nation's official list of properties worthy of preservation. Listing on the National Register recognizes the importance of these properties to the history of our country and provides them with a measure of protection. In addition, owners of income producing properties may qualify for federal and/or state income tax benefits. Homeowners in qualifying census tracts may qualify for state income tax benefits for approved work. Properties owned by municipalities and not-for-profit organizations are eligible to apply for state historic preservation matching grants.

If you would like more information about any of these programs, please contact your field representative, in this case, Kath LaFrank, at the Division for Historic Preservation (518) 288-2185. The Division maintains a continuing interest in all registered properties and will be happy to answer any questions you may have.

Sincerely,

R. Daniel Mackey
Deputy Commissioner for Historic Preservation and
Deputy State Historic Preservation Officer

RE: DOH/DEC/SEQRA – Proposed Utica Hospital/MVHS/New Construction (16 PR06600)
Mohawk Valley Health System – Integrated Health Campus

FILE: 30780/67677

Dear **Mr. Bonafide:**

Thank you for your correspondence dated July 17th in support of our on-going, project-related consultation with the Division of Historic Preservation. The information provided in your correspondence relative to the Phase IA Architectural Inventory Report, as well as the prior correspondence relative to the Phase IA Archaeological Investigation¹, help establish an important baseline from which to assess potential impacts as we move forward with project planning, including compliance with the State Environmental Quality Review Act (SEQRA).²

As you may be aware, the Mohawk Valley Health System (MVHS) is coordinating with local and state decision-makers and stakeholders to consolidate multiple, existing, licensed health care facilities into an integrated system of care, within the largest population center in Oneida County; an objective which is consistent with the New York State Department of Health (NYSDOH)-approved Certificate of Need.

Consequently, MVHS, in conjunction with its community partners, is seeking to construct the Integrated Health Campus (IHC) within the specified downtown location — 25± acres of property in an area of Utica that is designated as a Federal “Historically Underutilized Business” (“HUB”) Zone.³ While the primary project objective is to provide improved healthcare to the residents of the Mohawk Valley region, a secondary objective is to leverage this transformative once-in-a-lifetime project to become a catalyst for ongoing and future economic development of the region. The Oneida County Health Care Facility Transformation Program, a law enacted by the New York State Legislature in 2015, provides capital funding (\$300 million) “in support of projects located in the largest population center in Oneida County that consolidate multiple licensed health care facilities into an integrated system of care.”

¹ Correspondence dated June 18, 2018 from Josalyn Ferguson, Historic Preservation Specialist/Archaeology.

² The Utica City Planning Board, as SEQRA Lead Agency, is performing a coordinated SEQRA review including preparation of an Environmental Impact Statement (EIS).

³ HUBZone means a historically underutilized business zone, which is an area located within one or more: (1) Qualified census tracts; (2) Qualified non-metropolitan counties; (3) Lands within the external boundaries of an Indian reservation; (4) Qualified base closure areas; (5) Re-designated areas; or (6) Qualified disaster areas.

Implementing the project within the proposed downtown project area requires consolidation of properties within the project footprint under MVHS ownership. Consequently, MVHS is working with its community partners to acquire parcels through negotiations with existing property owners, with positive results. While MVHS continues to negotiate with remaining property owners, it is understood that full control of the project area may require the use of eminent domain.

In conformance with SEQRA requirements, we continue to evaluate project-related impacts associated with implementation of the project, including potential impacts on cultural and historic resources. The need to provide your office with additional information to facilitate compliance with the National and State Historic Preservation Acts is also understood.

We are currently assessing potential project-related impacts on cultural resources and evaluating potential project changes and/or mitigation to minimize or eliminate those impacts. It is our intent to provide you with our findings so that we can continue our dialogue toward impact resolution. It is our understanding that such resolution will be codified in a "Letter of Resolution" (LOR), agreed upon by involved parties, and addressing significant adverse impacts and a consensus-based mitigation plan. We also understand that development of the LOR will be based on our compilation and provision, and your subsequent review, of information relative to those considerations.

The type of information your office is requesting on targeted properties will require on-site evaluations, which are currently limited by the Team's inability to access all the sites within the project footprint. While MVHS continues its efforts to obtain full site control, it is important to note that eminent domain procedures cannot be initiated until the City of Utica Planning Board, as SEQRA Lead Agency, has completed its coordinated SEQRA efforts (*i.e.*, issuance of SEQRA Findings).

We are reaching out to you in response to your recent phone conversation with our cultural resource consultant, Mike Cinquino (Panamerican Consultants, Inc.), to identify and obtain consensus on a path forward to obtain an acceptable LOR; a process that accounts for the current site accessibility restrictions, the need to provide for an adequate SEQRA review, and which accounts for a balancing of needs between cultural resource sensitivities and regional healthcare objectives. For the purposes of SEQRA, we would like to work toward a written "pre-agreement" with your office relative to an acceptable path forward.

We are available to meet with you in person or by conference call at your convenience. Please advise. I can be reached at (315) 956-6421 or steve.eckler@obg.com. Thanks for your continued diligence on this important regional project.

Very truly yours,
O'BRIEN & GERE ENGINEERS, INC.

Executive Summary

This traffic impact study (TIS) evaluates the potential transportation impacts to the highway system from the Integrated Health Campus (IHC) Project, a hospital and medical office building development, proposed by the Mohawk Valley Health System (MVHS) in the City of Utica, New York anticipated to be completed in 2022. This project is expected to include a 688,000 square foot (SF) hospital building with 373 beds and 2,400 employees, an 80,000 SF medical office building, a central utility plant, heliport, a 1,550 space parking garage, and numerous surface parking facilities.

The MVHS IHC will be bound by New York State (NYS) Route 5S (Oriskany Street) to the north, Broadway to the east, NYS Route 5/8/12 to the West, and Columbia Street/City Hall/Kennedy Apartments to the south. For the purposes of the TIS, the study area incorporates all the intersections to be analyzed and defines the limits of any additional evaluations such as on-street parking impacts or accident analyses. Study area limits were defined based on discussions with the New York State Department of Transportation (NYSDOT) Region 2 and includes the following intersections:

- | | |
|---|--|
| 1. NYS Route 5/8/12 NB off-ramp at Court Street | 15. Washington Street & Oriskany Street |
| 2. State Street & NYS Routes 5/8/12 off/on-ramp | 16. Washington Street & Lafayette Street |
| 3. State Street & Lafayette Street | 17. Seneca Street & Liberty Street |
| 4. State Street & Columbia Street | 18. Seneca Street & Oriskany Street |
| 5. State Street & Court Street | 19. Seneca Street & Lafayette Street |
| 6. Cornelia Street & Oriskany Street | 20. Genesee Street & Liberty Street |
| 7. Cornelia Street & Lafayette Street | 21. Genesee Street & Oriskany Street |
| 8. Cornelia Street & Columbia Street | 22. Genesee Street & Lafayette/Bleecker Street |
| 9. Cornelia Street & Court Street | 23. Genesee Street & Columbia/Elizabeth Street |
| 10. Broadway & Oriskany/Liberty Street | 24. Genesee Street SB off-ramp & Whitesboro Street |
| 11. Broadway & Lafayette Street | 25. Genesee Street & Blandina Street |
| 12. Broadway & Columbia Street | 26. Genesee Street & Bank Place |
| 13. Broadway & Court Street | 27. Genesee Street & Court Street |
| 14. Washington Street & Liberty Street | |

Intersection turning movement counts were collected during typical AM (7am – 9 am) and PM (4pm – 6pm) peak hours at the study intersections on July 18th and 19th, 2018. While peak hours for individual intersections varied, the overall study peak hours were determined to be from 7:45am – 8:45am and 4pm – 5pm.

A capacity analysis was performed using SYNCHRO 10 for the study area using the existing condition traffic volumes with existing roadway and intersection geometry information. Each of the study intersections operate at a LOS C or better during the peak hours. There are a few movements at some intersections that operate at a LOS E or F as noted below:

- 6 – Cornelia Street & Oriskany Street (PM)
 - Northbound LT/THRU/RT = LOS F (96.2 sec)
- 17 – Seneca Street & Liberty Street (AM)
 - Northbound LT/THRU/RT = LOS E (38.2 sec)

MVHS IHC Traffic Impact Study – Executive Summary

The future no-build condition includes the proposed geometric, traffic control, and traffic distribution changes for NYS Route 5S that are currently being constructed as well as a growth of existing traffic to account for other unknown development in the area through 2022. Provided by the NYSDOT, a 1% growth rate is used to estimate no-build condition volumes for 2022. Information regarding the proposed expansion of the AUD including the NEXUS Center is not available at this time and cannot be included in the analysis for this study.

Each of the study intersections operate at a LOS C or better during the peak hours for the future no-build condition except for intersection 4 – State Street & Lafayette Street during the PM peak hour which changed from an average intersection LOS C (30.1 sec) to a LOS D (43.8 sec). There are a few movements at some intersections that were noted at a LOS E or F for the future no-build condition as noted below:

- 3 – State Street & Lafayette Street (PM)
 - Northbound THRU/RT = LOS F (84.1 sec) previously LOS D (52.2 sec)
- 6 – Cornelia Street & Oriskany Street (AM)
 - Northeastbound (from off-ramp) THRU/RT = LOS E (55.0) previously LOS D (42.4 sec)
- 6 – Cornelia Street & Oriskany Street (PM)
 - Northeastbound (from off-ramp) THRU/RT = LOS E (63.0) previously LOS D (44.4 sec)
- 10 – Broadway & Oriskany/Liberty Street (PM)
 - Southbound LT = LOS E (58.5 sec) previously did not exist as a dedicated movement
- 20/21 – Oriskany Street & Genesee Street (AM)
 - Northbound L = LOS E (56.6 sec) previously did not exist as a dedicated movement

The future build condition includes the additional traffic anticipated to be generated due to the proposed development and any changes in traffic patterns associated with building access, roadway closures, or access to proposed parking facilities:

- On-site parking totals 1,830 spaces in the following facilities:
 - Parking garage on the property bound by State Street, Lafayette Street, Cornelia Street, and NYS Route 5S – contains 1,550 total spaces, 500 of which will be dedicated to City use. Access will be on Cornelia Street and State Street. It is assumed all public patients and visitors to the hospital will park here along with some employees.
 - Two employee surface parking lots: 219 space facility just west of State Street and north of Lafayette Street with access on State Street and a 107 space facility just west of State Street between Lafayette Street and Columbia Street with access on Columbia Street
 - Surface parking lot with 375 spaces adjacent to the medical office building with access on State Street and Cornelia Street
 - Emergency Department surface parking between the main hospital building and State Street with a total of 79 spaces with access on Columbia Street and State Street as well as direct access to the garage
- A pedestrian walkway and access to the emergency department entrance will replace Lafayette Street between Cornelia Street and State Street.
- Lafayette Street from Broadway to Cornelia Street will become the main entrance to the IHC
- Cornelia Street from Columbia Street to Oriskany will be abandoned by the City
- Cornelia Street from Lafayette Street to Oriskany Street will lead to the main entrance to the hospital and provide an access to a new public parking garage
- Carton Avenue, Sayre Alley, and Pine Street will be abandoned by the City

MVHS IHC Traffic Impact Study – Executive Summary

Using the Institute of Engineers (ITE), Parking Generation Manual, 3rd Edition, the anticipated parking demand associated with the proposed MVHS IHC was estimated for comparison to the proposed parking supply. Land use codes 610 – Hospital and 720 – Medical-Dental Office were used to estimate the anticipated peak (weekday) parking demand. Based on this evaluation, the proposed development plan provides adequate parking for its patients, staff, and visitors.

	Proposed Supply	Anticipated Peak Demand	Estimated Surplus
Hospital	1,455	1,440	15
Medical Office Building	375	283	92
Total	1,830	1,723	107

The 10th Edition of ITE's Trip Generation Manual was used to estimate the traffic that will be generated by the proposed development during the typical weekday AM and PM peak hours. Using the same land use codes and variables (hospital employees and SF of medical office building), the trip generation for the proposed project is shown below:

	AM Peak Hour			PM Peak Hour		
	Entering	Exiting	Total	Entering	Exiting	Total
Hospital	476	176	652	185	500	685
Medical Office Building	143	40	183	76	197	273
Total	619	216	835	261	697	958

As part of the analysis included for the NYS Route 5S project, an initial trip generation and distribution for the proposed MVHS IHC project was developed to be incorporated in their future conditions modeling. A letter memo was developed by GTS Consulting in March 2016 that used initial development assumptions and data provided by the MVHS regarding employee and patient zip code information to determine peak hour regional distributions. While the project information has changed since that memo was developed that significantly changes trip generation estimates, the employee and patient information and routing assumptions are still valid. Therefore, the regional distribution from that memo was used for this analysis.

The local distribution of project-generated trips within the study area is based on the most logical routing to/from the larger/busier highways and roadways to/from each individual parking facility access. The number of trips allocated to/from each parking location is based on the size of the facility and on the following assumptions:

- All hospital related trips are routed to/from the garage, employee parking lots, and the emergency department parking based on the regional distribution, proportion of number of spaces available at each facility (i.e., the garage would see the most trips, then the larger employee lot, the smaller employee lot, and the emergency department parking would have the least number of trips assigned to it), and the most direct route to/from each access point
- The trips generated by the medical office building are directed to/from the parking lot adjacent to the building

When compared to the future no-build scenario analysis results, all of the study intersections operate at LOS C or better in the future build condition except for intersection 3 – State Street & Lafayette

MVHS IHC

Traffic Impact Study – Executive Summary

Street/ Emergency Department Access (average intersection LOS F (85.6 sec) previously LOS D (43.8 sec)) and 6 – Cornelia Street & Oriskany Street (average intersection LOS D (42.4 sec) previously LOS C (21.8 sec)), both during the PM peak hour. The following movements are expected to operate at a LOS E or F:

- 3 – State Street & Lafayette Street/ED Access (PM)
 - Northbound THRU/RT = LOS F (101.4 sec) previously LOS F (84.1 sec) when Lafayette Street continued eastbound through State Street
 - Southbound THRU/RT = LOS F (91.9 sec) previously LOS B (19.5 sec)
- 5 – State Street & Court Street (PM)
 - Northbound LT = LOS E (63.9 sec) previously LOS C (22.1 sec)
- 6 – Cornelia Street & Oriskany Street (AM)
 - Northbound LT/THRU/RT = LOS E (72.2) previously LOS D (53.4 sec)
- 6 – Cornelia Street & Oriskany Street (PM)
 - Northbound LT/THRU/RT = LOS F (176.3) previously LOS E (63.9 sec)
- 10 – Broadway & Oriskany/Liberty Street (AM)
 - Southbound LT = LOS E (55.9 sec) previously D (52.7 sec)
- 20/21 – Oriskany Street & Genesee Street (PM)
 - Northbound THRU = LOS E (74.1 sec) previously D (52.8 sec)

There is expected to be some delay during the PM peak hour for vehicles exiting the new parking garage onto State Street (LOS F (79.2 sec)). It is not anticipated that this delay, internal to the garage, will impact operations of the adjacent roadways.

Additional modeling scenarios were developed to determine what mitigation measures would be required to improve operations to future no-build scenario operations or better. There will be no recommended changes to mitigate the LOS F with 79.2 seconds of delay expected for traffic exiting the garage during the PM peak hour. It is assumed that these delays (only noted during the PM peak hour) will not warrant a signal at the intersection of State Street and the garage/proposed employee parking lot. The delays during the PM peak hour at intersection 6 – Cornelia Street and Oriskany Street cannot be completely mitigated with signal timing changes, but the delays are lessened. The installation of a left turn lane was considered, but did not provide a significant improvement to the LOS compared to the anticipated costs and impacts to the soon to be reconstructed Oriskany Street (NYS Route 5S). The intersection is expected to operate overall at a LOS C during the AM peak hour and at a LOS D during the PM peak hour.

Based on these analyses, it was determined that the proposed development will not have a significant adverse impact on the adjacent transportation network with the following mitigation measures implemented beyond what is expected as part of the development plan for the project:

- Ensure adequate pedestrian facilities are available from each proposed parking area to the access points of the main hospital building
- Optimize signal timings at the following intersections:
 - 3 – State Street & Lafayette Street/Emergency Department Access (PM)
 - 5 – State Street & Court Street (PM)
 - 6 – Cornelia Street & Oriskany Street (AM & PM)
 - 10 – Broadway & Oriskany/Liberty Street (AM)
 - 20/21 – Oriskany Street & Genesee Street (PM)

Section 1—Introduction

1.1 Project Description

This traffic impact study (TIS) evaluates the potential transportation impacts to the highway system from the Integrated Health Campus (IHC) Project, a hospital and medical office building development, proposed by the Mohawk Valley Health System (MVHS) in the City of Utica, New York. This project is expected to include a 688,000 square foot (SF) hospital building with 373 beds and 2,400 employees, an 80,000 SF medical office building, a central utility plant, heliport, a 1,550 space parking garage, and numerous surface parking facilities.

The MVHS IHC will be bound by New York State (NYS) Route 5S (Oriskany Street) to the north, Broadway to the east, NYS Route 8 to the West, and Columbia Street/City Hall/Kennedy Apartments to the south. The proposed site is approximately 25 acres just south of the Utica Memorial Auditorium near the City’s urban core, the proposed “U” District, Brewer District, Bagg’s Square, and Utica Harbor Point. A location map of the site is included as **Figure 1.1**.

1.2 Study Area

For the purposes of the TIS, the study area incorporates all the intersections to be analyzed and defines the limits of any additional evaluations such as on-street parking impacts or accident analyses. Study area limits were defined based on discussions with the New York State Department of Transportation (NYSDOT) Region 2 and includes the following intersections (see **Figure 1.2**):

- | | |
|---|--|
| 1. NYS Route 5/8/12 NB off-ramp at Court Street | 15. Washington Street & Oriskany Street |
| 2. State Street & NYS Routes 5/8/12 off/on-ramp | 16. Washington Street & Lafayette Street |
| 3. State Street & Lafayette Street | 17. Seneca Street & Liberty Street |
| 4. State Street & Columbia Street | 18. Seneca Street & Oriskany Street |
| 5. State Street & Court Street | 19. Seneca Street & Lafayette Street |
| 6. Cornelia Street & Oriskany Street | 20. Genesee Street & Liberty Street |
| 7. Cornelia Street & Lafayette Street | 21. Genesee Street & Oriskany Street |
| 8. Cornelia Street & Columbia Street | 22. Genesee Street & Lafayette/Bleecker Street |
| 9. Cornelia Street & Court Street | 23. Genesee Street & Columbia/Elizabeth Street |
| 10. Broadway & Oriskany/Liberty Street | 24. Genesee Street SB off-ramp & Whitesboro Street |
| 11. Broadway & Lafayette Street | 25. Genesee Street & Blandina Street |
| 12. Broadway & Columbia Street | 26. Genesee Street & Bank Place |
| 13. Broadway & Court Street | 27. Genesee Street & Court Street |
| 14. Washington Street & Liberty Street | |

See Section 2.1 for more detailed roadway network information.

1.2

1.3 Methodology

The methodology used to determine the impacts of the traffic generated by the proposed development was discussed and approved with the NYSDOT, Region 2. Several traffic conditions or scenarios were established and considered for the study intersections. The traffic conditions considered in this report are as follows:

- Existing (2018) traffic conditions during the typical AM and PM peak commuter periods
- Future (2022) no-build traffic conditions during the typical AM and PM peak commuter periods
- Future (2022) build traffic conditions during the typical AM and PM peak commuter periods
- Future (2022) mitigated traffic conditions during the typical AM and PM peak commuter periods, if necessary

The no-build condition includes the proposed geometric and traffic control changes for NYS Route 5S that are currently being constructed as well as a growth of existing traffic to account for other unknown development in the area through 2022. Provided by the NYSDOT, a 1% growth rate is used to estimate no-build condition volumes for 2022.

The future build condition includes the additional traffic anticipated to be generated due to the proposed development and any changes in traffic patterns associated with building access, roadway closures, or access to proposed parking facilities. Based on the results of the analysis of traffic operations for the future build condition, the mitigated condition contains any changes to lane configurations, signal timing and phasing, or any other changes to the roadway network or proposed development plan necessary to mitigate impacts to traffic operations.

Adjacent to the proposed site to the north, the Utica Memorial Auditorium (the AUD) is a multi-purpose arena and home to the Utica Comets of the American Hockey League. A planned expansion to the AUD including the proposed NEXUS Center will include additional game fields, lockers rooms, office space, classroom space, retail, food and beverage services, and other training space. The NEXUS Center is expected to be developed to the east of the AUD up to Broadway. Based on conversations with the NYSDOT and the Upper Mohawk Valley Memorial Auditorium Authority (August 2018), current events at the AUD typically do not impact commuter peak periods and there is not enough detailed information available regarding the AUD expansion and NEXUS Center to include potential impacts in this TIS. Therefore, traffic generated during AUD events or potential traffic generated by the AUD expansion and NEXUS Center are not included in this study.

The effect of the IHC Project on the adjacent roadway network was measured by comparing the operations of the study intersections to operations that are typically considered acceptable. The study intersections were analyzed using SYNCHRO 10¹, a computer program that implements the methods presented in the Highway Capacity Manual. SYNCHRO determines the level of service (LOS), which is defined in terms of delay, as well as anticipated queue lengths.

The LOS for both signalized and unsignalized intersections are defined in terms of control delay. Control delay is a measure of the total travel time lost and includes slowing delay, stopped delay, queue move-up time, and start-up lost time. LOS thresholds are defined as average delay in seconds per vehicles over a fifteen-minute analysis period and range from LOS A to F for both signalized and unsignalized intersections. An overall intersection LOS D or better is generally considered acceptable at a signalized intersection. An overall intersection LOS E or better is generally considered acceptable at an unsignalized intersection. The following table provides a summary of the LOS thresholds as defined in the HCM 2010.

Table 1.1—Intersection Level of Service Criteria

Level of Service (LOS)	Signalized Intersections	Unsignalized Intersections
	Delay (sec)	Delay (sec)
A	0-10	0-10
B	> 10-20	> 10-15
C	> 20-35	> 15-25
D	> 35-55	> 25-35
E	> 55-80	> 35-50
F	over 80	over 50

Source: HCM 2010, Chapters 18/19

The TIS also includes an accident history for the study area and a parking supply and demand analysis associated with the proposed development.

Section 2—Existing Conditions

2.1 Roadway Network

Intersections

The study area includes the following 27 intersections, as shown in Figure 1.2:

NYS Route 5/8/12 NB off-ramp with:

- Court Street

State Street with:

- Court Street
- Columbia Street
- Lafayette Street
- NYS Routes 5/8/12 off/on-ramp

Cornelia Street with:

- Court Street
- Columbia Street
- Lafayette Street
- Oriskany Street

Broadway with:

- Court Street
- Columbia Street
- Lafayette Street
- Oriskany/Liberty Streets

Washington Street with:

- Lafayette Street
- Oriskany/Liberty Streets

Seneca Street with:

- Lafayette Street
- Oriskany/Liberty Streets

Genesee Street with:

- Court Street/Hopper Street
- Bank Place
- Washington Lane/Blandina Street
- Columbia Street/Elizabeth Street
- Lafayette Street/Bleecker Street
- Oriskany/Liberty Streets
- Whitesboro Street (Genesee St SB off-ramp)

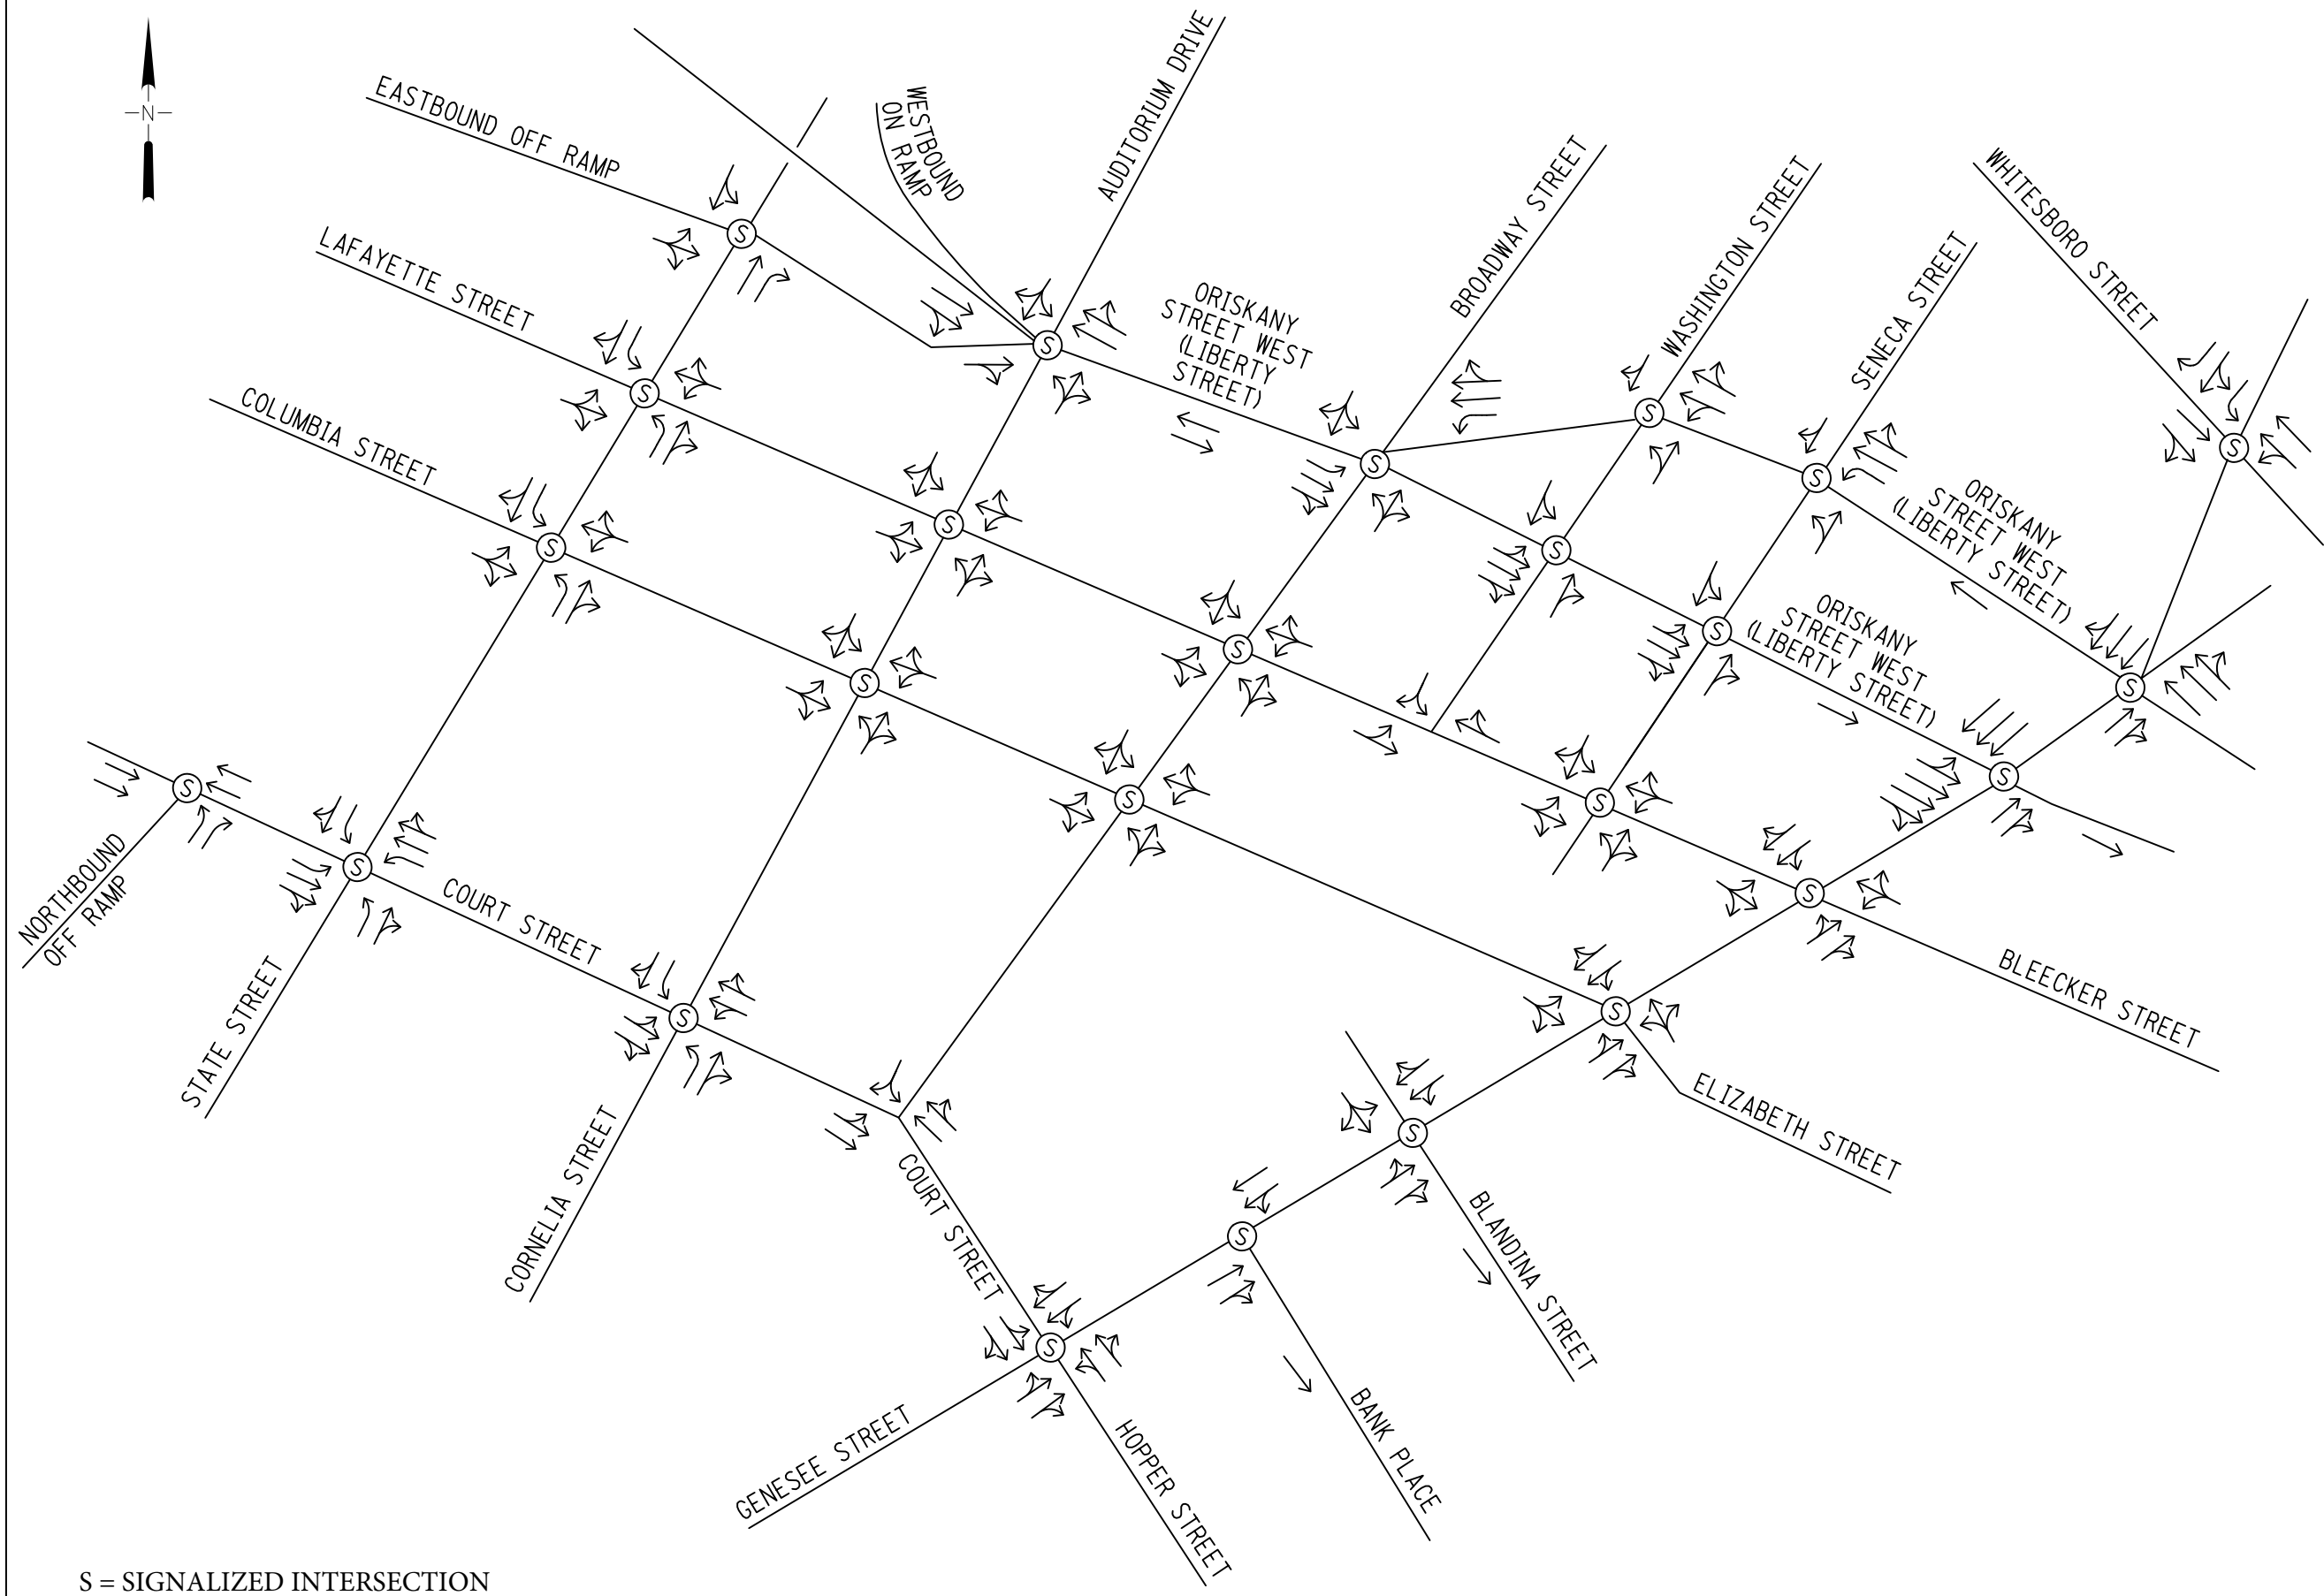

Figure 2.1 shows the existing lane configurations and traffic control for each of the study intersections.

Roadways:

Information for the following roadway and intersection characteristics was provided by C&S Engineers, Inc. via a field visit, desktop analysis in Google Maps, and the New York State Department of Transportation (NYSDOT) Functional Class Viewer. Centro bus routes that operate along any study area roadways are also noted.

FIGURE
2.1

Although there are no designated bike lanes anywhere throughout the study area, the majority of roadways do have sidewalks. Within the study area, sidewalks are missing from the following road segments:

- West side of State Street between Oriskany St. and Lafayette Street
- East side of Cornelia Street between the entrance to the Kennedy Parking Garage and the Utica City Hall building
- West side of Broadway between Oriskany Street and Lafayette Street

Roadways within the study area are summarized as follows:

Bank Place is an urban local street situated at the eastern edge of the study area. It is a one-way road running southeast from Genesee Street to outside of the study area onto Union Street. Curb cut buffered parking is provided on the southern side of Bank Place.

Blandina Street is an urban local street situated on the eastern edge of the study area that becomes Washington Lane at its intersection with Genesee Street. This one-lane road runs southeast from Genesee Street towards Charlotte Street (located outside of the study area). Street parking is available on both sides of the street.

Bleecker Street is an urban major collector. This two-way roadway has one travel lane in each direction and runs east/west. This roadway becomes Lafayette Street west of Genesee Street and eventually becomes County Road 241 to the east when outside of city limits. On-street parking is available on both sides of the street within the study area and this street contains bus stops for the Centro UT 12 and UT 14 bus lines outside of the study area.

Broadway is a two-way urban local street. It has one travel lane in each direction and runs northeast/southwest, terminating at Court Street and Whitesboro Street (outside of the study area). Broadway provides direct access to NYS Route 5S, an urban arterial.

Columbia Street is an urban major collector. It runs southeast/northwest from Whitesboro Street and Genesee Street (both outside of the study area). It is a two-way roadway with one travel lane in either direction. On-street parking is available on both sides of the street and has bus stops for the Centro UT 20, UT 11, and UT 111 bus lines.

Cornelia Street is a two-way urban street that cuts through the center of the study area. It runs southwest/northeast and terminates at Oriskany Street and Mandeville Street (both outside of the study area). On-street parking is available on portions of the street.

Court Street is an urban minor arterial. Within the study area, it is a two-way street with two travel lanes in each direction. This street terminates at Whitesboro Street (outside of the study area) and Genesee Street, east of which it becomes Hopper Street. Within the study area, there are no bus lines on this street or on-street parking.

Elizabeth Street is an urban major collector that becomes Columbia Street west of Genesee Street. Elizabeth Street runs southeast/northwest, terminating at Genesee Street

and Nichols Street (outside of the study area). It is a two-way road with a travel lane in both directions. There is on-street parking available on both sides of the street and the street is serviced by the Centro UT 12 bus line outside of the study area.

Genesee Street is an urban principal arterial. It has two travel lanes that run northeast through the study area and feeds into Oriskany Street (an urban arterial) after which it becomes North Genesee Street and feeds into I-790/I-90 (principal arterial-interstates) north of the study area. It also has two travel lanes that run southwest through the study area towards NYS Route 8 (a principal arterial expressway) and eventually terminates at NYS Route 12/Seneca Turnpike (a principal arterial) and Highway 5 (a principal arterial expressway) outside of the study area. There is on-street parking on both sides of the street throughout the study area. Centro bus lines that service this street include UT 15, UT 22, UT 24, UT 40, and UT 31.

Hopper Street is an urban minor arterial. It has two travel lanes in either direction and runs northwest/southeast, connecting Steuben Park (outside of the study area) to Genesee Street. West of Genesee Street, Hopper Street becomes Court Street. On-street parking is available on both sides of Hopper Street and it is serviced by the Centro bus line UT 22 outside of the study area.

Lafayette Street is an urban major collector. It becomes Bleecker Street east of Genesee Street and also terminates at Whitesboro Street (west of the study area). It is a two-way street with one travel lane in each direction. There is on-street parking available on both sides of the street. Centro bus stops on this street are for the following routes: UT 11, UT 20, and UT 111 lines.

NYS Route 5S is also known as Oriskany Street West, Oriskany Street East, and Liberty Street. Oriskany Street West begins in Yorkville and ends at the Genesee Street Intersection. Oriskany Street East begins at the Genesee Street Intersection and ends at the Broad Street Intersection. Liberty Street begins adjacent to the northern portion of Genesee Street and extends to Broadway along the one-way westbound portion of NYS Route 5S (Oriskany Street West). Although this street is not located in the study area, it is located directly to its north and runs east/west, so many of the streets running north/south in the study area do feed into it. It is an urban principal arterial and contains two travel lanes in each direction with a dividing barrier.

NYS Routes 5/8/12 (also known as the North-South Arterial) is located on an elevated roadway west of the study area. It is an urban principal arterial other running north/south that connects to Oriskany Street/NYS Route 5S and eventually I-790 and I-90 (all north of the study area). This road has two travel lanes in both directions with a dividing barrier.

Sayer Alley is a one-way local alley that connects Lafayette Street with Columbia Street. It has a bi-directional single travel lane.

Seneca Street is a two-way urban local street that dead-ends mid-block south of Lafayette Street to provide on-street parking to local businesses. North of Lafayette Street, Seneca Street is a two-way urban street with on-street parking available on both sides. This portion of the street provides access to Oriskany Street outside of the study area before becoming Water Street. It has one travel lane in each direction.

State Street is an urban minor arterial. It runs along the western edge of the study area and terminates outside of the study area on Genesee Street to the south and Oriskany Street to the north where it provides the only direct access to I-790 and I-90 via NYS Routes 5/8/12 since the northbound access at Court Street was eliminated. Within the study area, it has two travel lines in each direction. On-street parking is only available on the 700-block of the street.

Washington Street is an urban local street located in the northern portion of the study area. This two-way street has one travel lane in each direction to provide access from Lafayette Street to Oriskany Street. It terminates to the north of the study area on Whitesboro Street. Within the study area, parking is available on the western side of the street.

Washington Lane is a two-way, one-block urban local street. East of Genesee Street, Washington Lane becomes Blandina Street. At its termination to the west, it becomes Washington Street. Washington Lane mainly provides access to the Washington Street Parking Garage and does not have on-street parking available.

2.2 Traffic Volumes

Intersection turning movement counts were collected during typical AM (7am – 9 am) and PM (4pm – 6pm) peak commuter travel periods at the study intersections on July 18th and 19th, 2018. While peak hours for individual intersections varied, the overall study peak hours were determined to be from 7:45am – 8:45am and 4pm – 5pm. Typically, traffic volume data is collected when local schools are in session. Since these counts were conducted in July, the data was compared to counts collected for the NYS Route 5S project to determine if they should be adjusted. Based on the comparisons and what is known of the recent traffic volume trends, it was determined that an adjustment to the July volumes was not necessary. The existing AM and PM peak hour volumes for the study area intersections are shown on **Figure 2.2**.

The highest pedestrian volumes were noted along the Genesee Street intersections as well as Columbia Street at Cornelia Street and State Street. There were very few bicyclists observed during the peak hours. The existing AM and PM peak hour pedestrian volumes for the study area intersections are shown on **Figure 2.3**. The crossing volumes that are circled indicate the lack of pedestrian accommodations at that crossing location.

The existing turning movement count data sheets are included in **Appendix A**.

2.3 Level of Service Analysis

A capacity analysis was performed for the study area using the existing condition traffic volumes with existing roadway and intersection geometry information. Starting on page 2-15, **Table 2.1** shows the existing condition level of service (LOS), delay in seconds, volume to capacity ratio, and 95th percentile queues² for each lane group of each study intersection.

Each of the study intersections operate at a LOS C or better during the peak hours. There are a few movements at some intersections that operate at a LOS E or F as noted below:

- 6 – Cornelia Street & Oriskany Street (PM)
 - Northbound LT/THRU/RT = LOS F (96.2 sec)
- 17 – Seneca Street & Liberty Street (AM)
 - Northbound LT/THRU/RT = LOS E (38.2 sec)

The existing condition model reports are included in **Appendix B**.

² “The **95th-percentile queue** is defined to be the queue length that has only a 5% probability of being exceeded during the analysis time period. It is a useful parameter for determining the appropriate length of turn pockets, but it is not typical of what an average driver would experience.”

2.4 Accident Analysis

According to data extracted from the NYSDOT Accident Location Information System (ALIS) for Oneida County, New York for the period between March 1, 2015 and February 28, 2018, there have been 75 vehicular accidents reported within the study area, not including NYS Route 5S since that was analyzed separately by the NYSDOT. Accident occurrence by street location during this period are summarized in **Table 2.2**.

Table 2.2—Accident Occurrence

Street	# of Accidents	% of Total
Bleecker St.	2	2.67%
Broadway	2	2.67%
Columbia St.	4	5.33%
Cornelia St.	4	5.33%
Court St.	12	16.00%
Devereux St.	3	4.00%
Elizabeth St.	3	4.00%
Genesee St.	17	22.67%
Hopper St.	4	5.33%
Kennedy Plz.	2	2.67%
Lafayette St.	6	8.00%
Seneca St.	3	4.00%
NYS Route 5S	1	1.33%
State St.	9	12.00%
Washington St.	3	4.00%
Total	75	100.00%

Source: NYSDOT ALIS, Oneida County for 3/1/15-2/28/18.
Compiled by C&S Engineers, Inc.

Of the accidents presented, approximately 23% occurred during inclement weather conditions (rain, snow, sleet, hail, or freezing rain) and approximately 17% occurred during non-daylight conditions (dusk or dark road/lighted conditions). In addition, 76% of these accidents occurred on roads that were straight and level, as opposed to those that occurred on curved or graded roads. Overall, this is indicative that the majority of accidents that occurred within the study area were under weather and visibility conditions not conducive to vehicular accidents.

As indicated by the NYSDOT ALIS data, 69% of the accidents reported in the study area occurred at intersections. Of the accidents that occurred at intersections, 64% occurred in the same exact geographic location as another reported accident. Intersection “hot spots” where accidents have occurred more than once are indicated in **Figure 2.4**.

Figure 2.4—Intersection Hot Spots

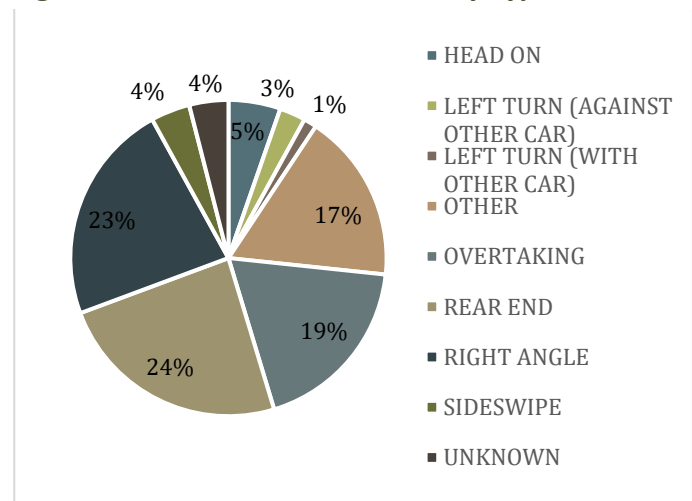

Source: NYSDOT ALIS, Oneida County for 3/1/15-2/28/18. Compiled by C&S Engineers, Inc.

Accident data was also analyzed by collision type. As indicated by **Figure 2.5**, approximately 24% of recorded accidents were rear ends, 23% were collisions from right angles, and 19% were collisions from overtaking. The cause of 17% of collisions were from other causes.

Traffic control types were associated by collision type. For rear end collisions, 50% occurred in association to traffic lights and 39% occurred when there was no traffic control type present. The remaining rear end collisions occurred at stop signs and flashing lights. Right angle collisions followed similar trends, with 53% occurring at traffic lights, 35% under no traffic control type, and the remaining from stop signs and flashing lights.

Figure 2.5—Percent of Accidents by Type

Source: NYSDOT ALIS, Oneida County for 3/1/15-2/28/18. Compiled by C&S Engineers, Inc.

Accident type information was also associated with the NYSDOT ALIS data. A majority (88%) of accidents documented were from collisions with other vehicles. Three (4%) of accidents were collisions with pedestrians and occurred under traffic signal control conditions. Six accidents (8%) occurred from collisions with fixed objects, fire hydrants, and guide rails. No accidents were reported with bicyclists.

Overall, this data also indicates that vehicle accidents are less likely to occur on the weekend than on a weekday. In addition, 89% of accidents within the study area have resulted in zero

injuries (18 resulted in an injury). No accidents within the study area for this set of data have resulted in fatalities.

A Highway Design Final Design Report for NYS Route 5S completed in 2017 for the NYSDOT includes a review of accident data for the segment of NYS Route 5S within the study area. This report indicated that locations within the City of Utica such as Broad Street, Genesee Street, and John Street have historically appeared on the NYSDOT's High Accident Location (HAL) listing for the years 2008, 2009, and 2010. This indicates that these streets have exhibited statistically higher accident rates than expected for roads with similar characteristics. Since the main objectives of the NYS Route 5S project are to 'reduce the potential for vehicle conflicts and reduce the overall accidents within the project limits' and to 'improve pedestrian and bicyclist safety, access, and mobility using complete streets strategies', it is assumed that the proposed design of that corridor will address the potential for future accidents at these locations.

See **Appendix C** for the ALIS data summarized in this section.

Section 3—Future No-Build Condition

3.1 NYS Route 5S Project

The NYSDOT is currently reconstructing NYS Route 5S from just west of Broadway to 1st Street with pavement overlays to Broad Street. As part of this project, the outside travel lane in both the eastbound and westbound directions will be eliminated. A cycle track will be added between Broadway and John Street, in the vicinity of this development's study area. The wide median on NYS Route 5S will be eliminated and the westbound lanes will be realigned to the south to be closer to the eastbound lanes. Liberty Street will be separated from the mainline and terminated at Seneca Street and a roundabout will be constructed at the intersection of John Street and Broad Street, outside of the study area. See **Appendix D** for a copy of the proposed reconstruction plans for NYS Route 5S from the Final Design Report dated June 2017.

Since this project is expected to be complete in October of 2019 and the MVHS IHC is expected to be complete in 2022, the changes to NYS Route 5S and the study area intersections due to this project are incorporated into the future no-build condition for the purposes of this study.

3.2 Future No-Build Volumes

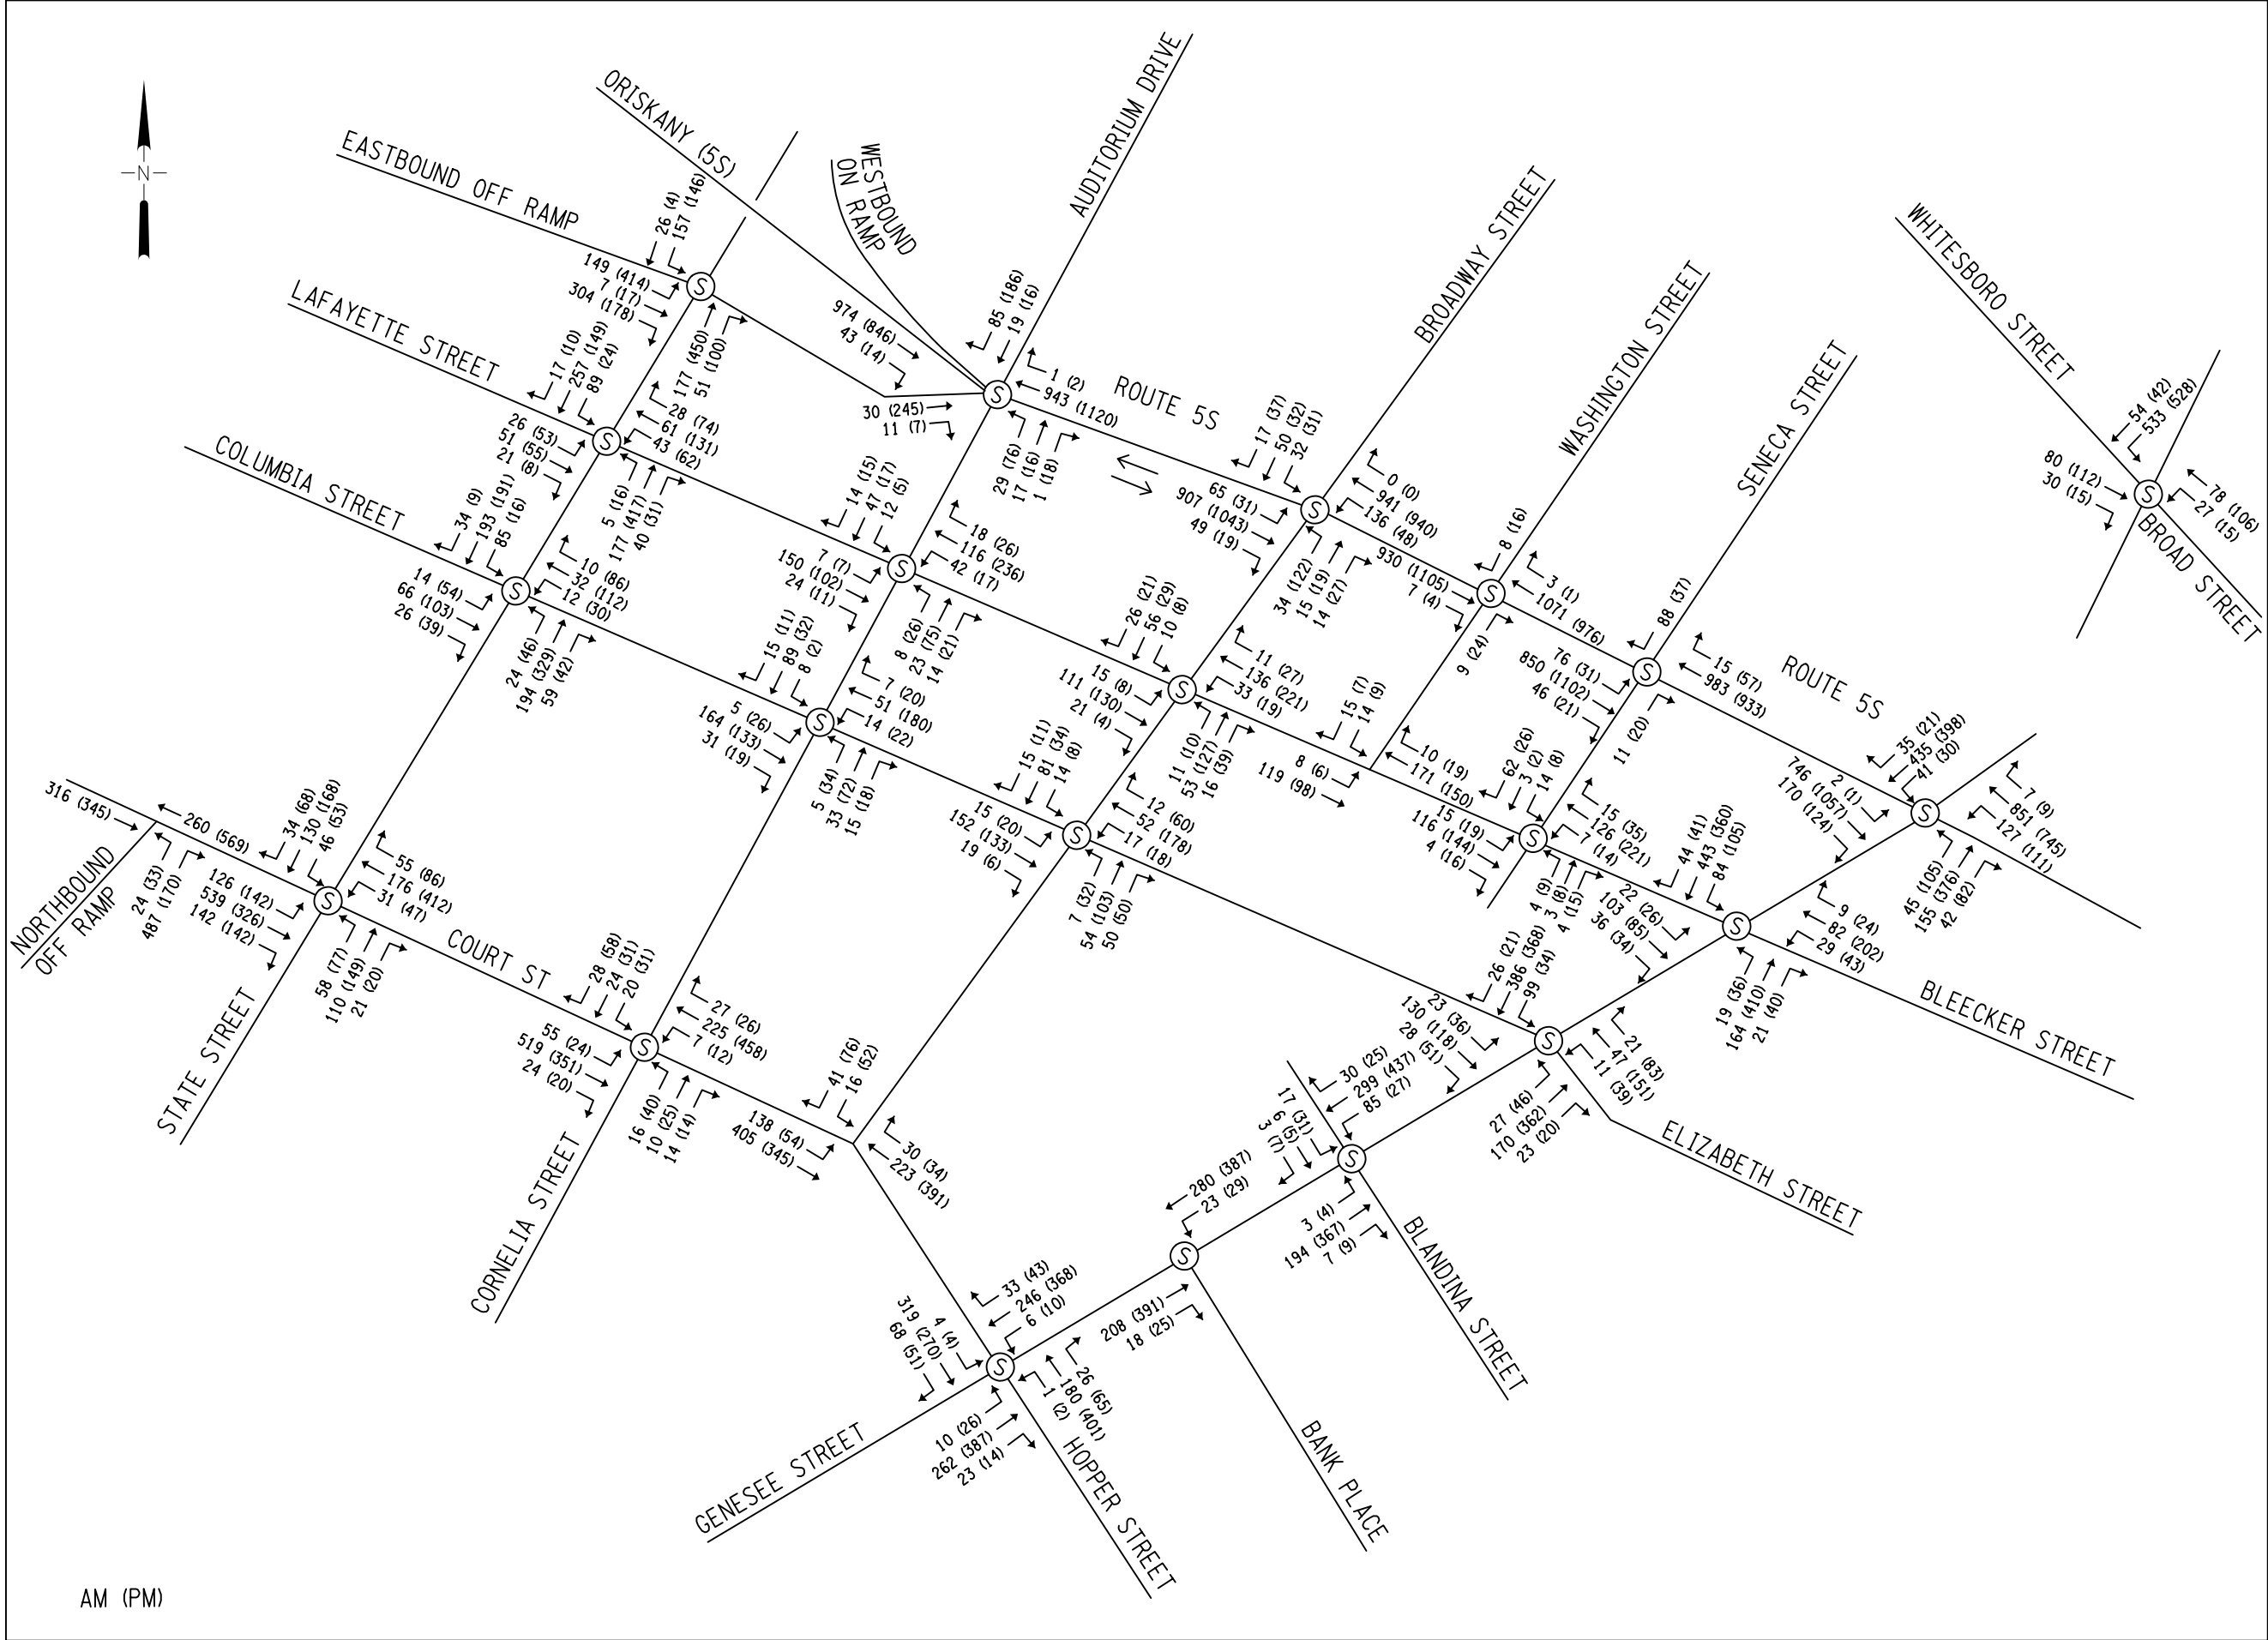

The MVHS IHC is expected to be complete in 2022. Based on guidance from the NYSDOT, a compound growth rate of 1% was applied to the existing 2018 volumes for four years to derive the 2022 future no-build condition volumes that account for any unknown development that may occur in the area.

When the NYS Route 5S project was being evaluated, much higher traffic volumes were assumed to be associated with the MVHS IHC project to be conservative in the analysis since more detailed information was not available at that time. Therefore, the volumes as noted in the NYS Route 5S Final Design Report were not used as part of this analysis, but the rerouting/redistribution of traffic along NYS Route 5S due to geometric/traffic control changes was considered as the future no-build condition volumes were developed. As stated previously, information regarding the proposed expansion of the AUD including the NEXUS Center is not available at this time and therefore was not included in the analysis for this study.

The future no-build AM and PM peak hour volumes for the study area intersections are shown on **Figure 3.1**.

FIGURE 3.1

MOHAWK VALLEY HEALTH SYSTEM TRAFFIC IMPACT STUDY
FUTURE NO BUILD (2022) PEAK HOUR VOLUMES

3.3 Future No-Build Analysis

A capacity analysis was performed for the study area using the future no-build condition traffic volumes with the proposed NYS Route 5S roadway changes and existing roadway and intersection geometry information for the remainder of the study area. Starting on page 3-7, **Table 3.1** shows the AM and PM peak hour future no-build condition level of service (LOS), delay in seconds, volume to capacity ratio, and 95th percentile queues³ for each lane group of each study intersection.

Each of the study intersections operate at a LOS C or better during the peak hours except for intersection 4 – State Street & Lafayette Street during the PM peak hour which changed from an average intersection LOS C (30.1 sec) to a LOS D (43.8 sec). There are a few movements at some intersections that were noted at a LOS E or F for the future no-build condition as noted below:

- 3 – State Street & Lafayette Street (PM)
 - Northbound THRU/RT = LOS F (84.1 sec) previously LOS D (52.2 sec)
- 6 – Cornelia Street & Oriskany Street (AM)
 - Northeastbound (from off-ramp) THRU/RT = LOS E (55.0) previously LOS D (42.4 sec)
- 6 – Cornelia Street & Oriskany Street (PM)
 - Northeastbound (from off-ramp) THRU/RT = LOS E (63.0) previously LOS D (44.4 sec)
- 10 – Broadway & Oriskany/Liberty Street (PM)
 - Southbound LT = LOS E (58.5 sec) previously did not exist as a dedicated movement
- 20/21 – Oriskany Street & Genesee Street (AM)
 - Northbound L = LOS E (56.6 sec) previously did not exist as a dedicated movement

The operations for a number of movements improved compared to the existing condition scenario due to the changes associated with the NYS Route 5S project. For example, the northbound movement at intersection 6 – Cornelia Street & Oriskany Street improved during the PM peak hour to a LOS E.

The future no-build condition model reports are included in **Appendix B**.

³ “The **95th-percentile queue** is defined to be the queue length that has only a 5% probability of being exceeded during the analysis time period. It is a useful parameter for determining the appropriate length of turn pockets, but it is not typical of what an average driver would experience.”

https://www.hcmguide.com/Case1/popup_terms/95_percentile_queue.htm

Section 4—Future Build Condition

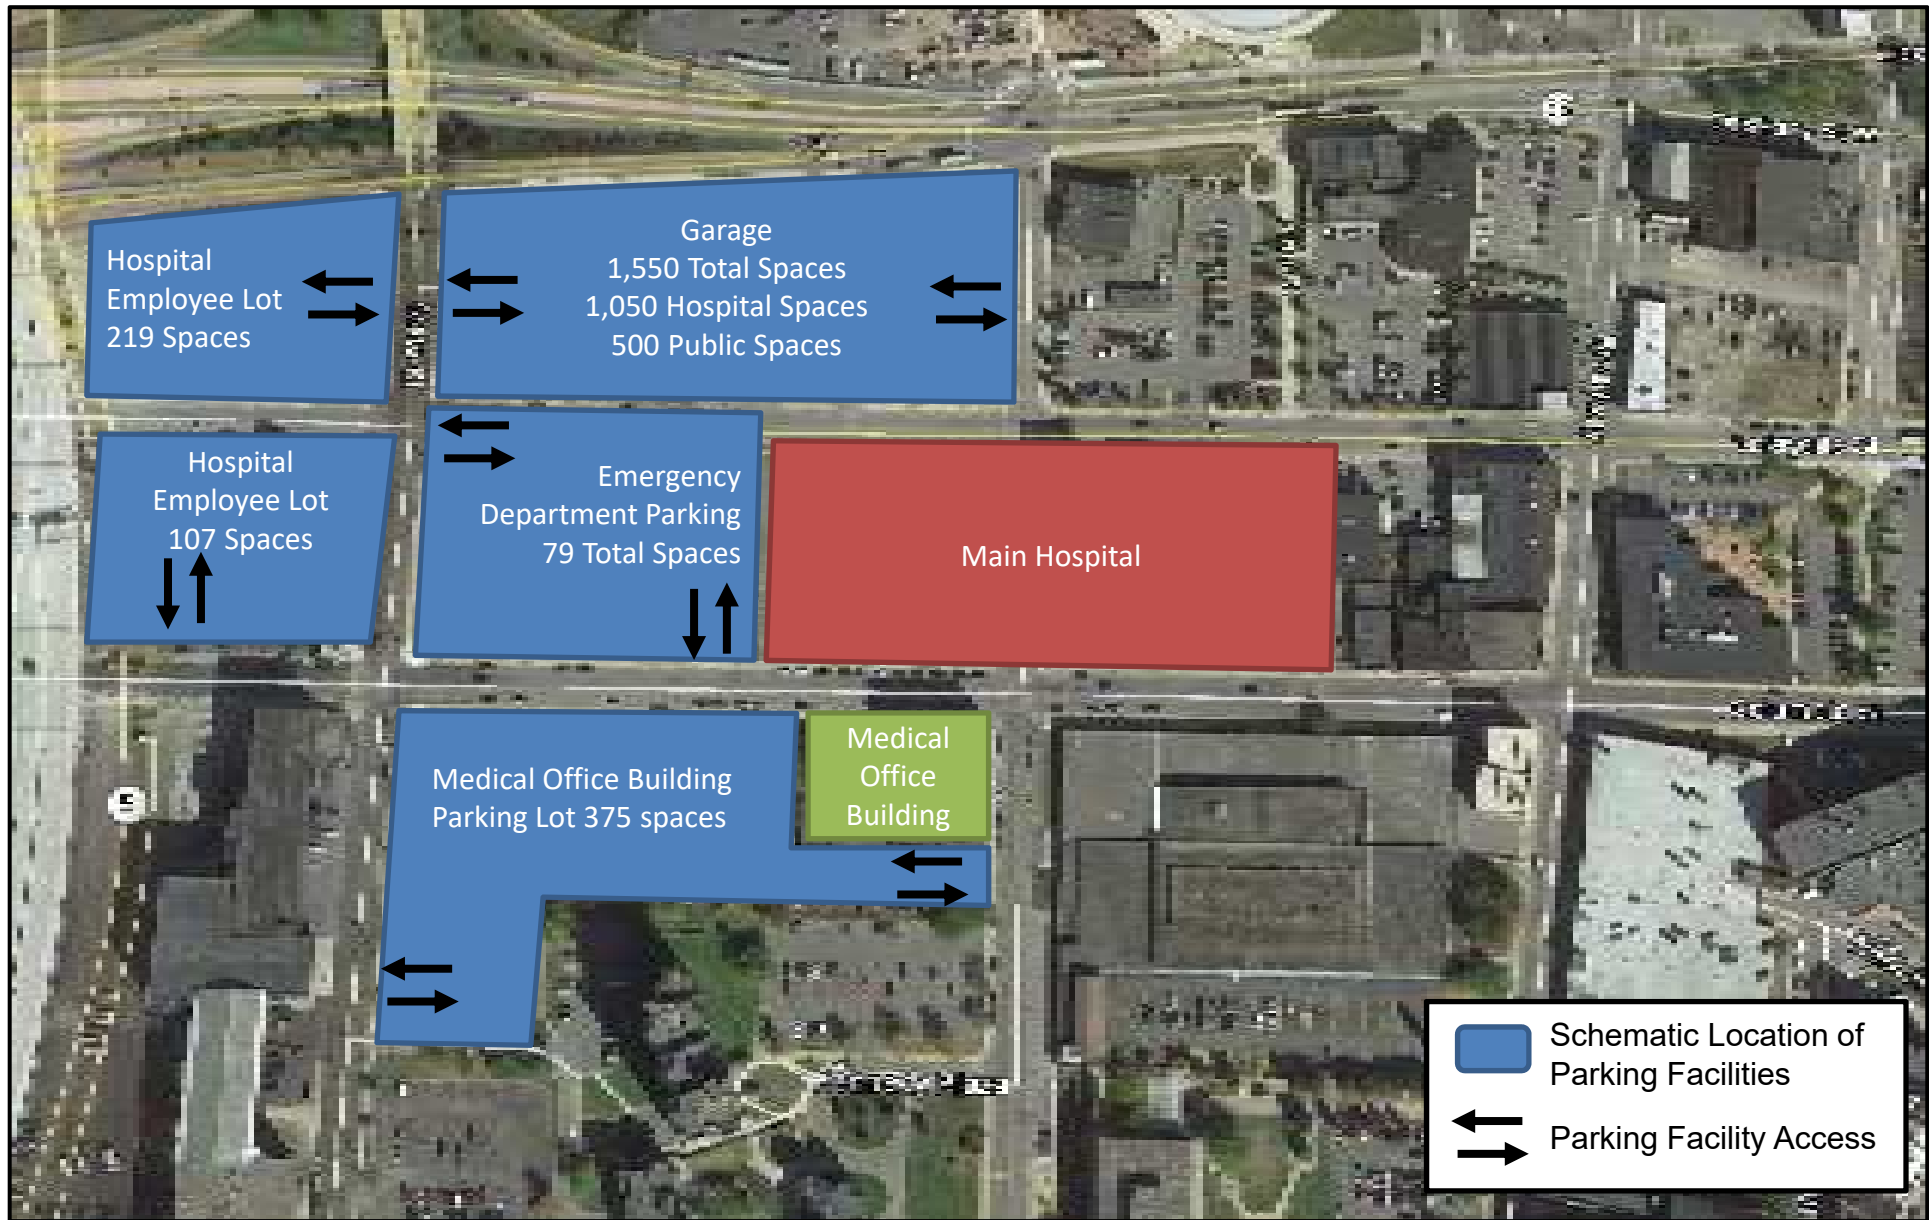

4.1 Proposed Development

The MVHS IHC project is expected to include a 688,000 square foot (SF) hospital building with 373 beds and 2,400 employees, an 80,000 SF medical office building, a central utility plant, heliport, a 1,550 space parking garage, and numerous surface parking facilities.

- The main hospital building will be constructed on parcels located west of Broadway and will extend through Cornelia Street onto parcels located east of State Street. The hospital building consists of a 2-story podium and 7-story bed tower.
- The central energy plant building will be located along the south side of Columbia Street between Cornelia Street and Broadway
- The medical office building is located at the southwest corner of the intersection of Columbia Street and Cornelia Street
- On-site parking totals 1,830 spaces in the following facilities (see **Figure 4.1**):
 - Parking garage on the property bound by State Street, Lafayette Street, Cornelia Street, and NYS Route 5S – contains 1,550 total spaces, 500 of which will be dedicated to City use. Access will be on Cornelia Street and State Street. It is assumed all public patients and visitors to the hospital will park here along with some employees.
 - Two employee surface parking lots: 219 space facility just west of State Street and north of Lafayette Street with access on State Street and a 107 space facility just west of State Street between Lafayette Street and Columbia Street with access on Columbia Street
 - Surface parking lot with 375 spaces adjacent to the medical office building with access on State Street and Cornelia Street
 - Emergency Department surface parking between the main hospital building and State Street with a total of 79 spaces with access on Columbia Street and State Street as well as direct access to the garage
- A pedestrian walkway and access to the emergency department entrance will replace Lafayette Street between Cornelia Street and State Street.
- The heliport will be located west of the hospital building, adjacent to the emergency department ambulance entrance and north of Columbia Street.

THIS PAGE INTENTIONALLY LEFT BLANK

To accommodate the proposed development, the project will involve the acquisition of properties and modifications to existing public and private utility infrastructure. The following roadways will be closed as part of the proposed project:

- Lafayette Street from State Street to Broadway will be abandoned by the City
- Lafayette Street from Broadway to Cornelia Street will become the main entrance to the IHC
- Cornelia Street from Columbia Street to Oriskany will be abandoned by the City
- Cornelia Street from Lafayette Street to Oriskany Street will lead to the main entrance to the hospital and provide an access to a new public parking garage
- Carton Avenue, Sayre Alley, and Pine Street will be abandoned by the City

4.2 Parking Generation

Using the Institute of Engineers (ITE), Parking Generation Manual, 3rd Edition, the anticipated parking supply and demand associated with the proposed MVHS IHC was estimated. Land use codes 610 – Hospital and 720 – Medical-Dental Office were used to estimate the parking supply needed and anticipated peak (weekday) parking demand. Based on the anticipated number of employees for the hospital and size of the medical office building, the parking supply and demand is estimated as shown in the table below:

Table 4.1—Parking Supply and Demand

ITE Land Use Code	Description	Unit	Urban Supply/Unit	Urban Peak Demand/Unit	MVHS Unit	Urban Supply	Urban Peak Demand
610	Hospital	Employees	0.72	0.6	2,400	1,728	1,440
720	Medical-Dental Office	GFA (kSF) ¹	3.9	3.53	80	312	283
					Totals	2,040	1,723

1: GFA – gross floor area, kSF – thousands of square feet

While the calculation for the hospital is based on the total number of employees, it takes into account all parking demand associated with the land use such as patients, visitors, as well as staff in an urban setting. This analysis indicates that hospitals with 2,400 employees along with an 80,000 SF medical office building typically provide approximately 2,000 parking spaces to accommodate their demand. The peak demand for the development is estimated at just over 1,700 spaces for a typical weekday.

The proposed development includes a total of 1,830 spaces. While it is less than ITE indicates is typically provided at similar facilities, it is more than is anticipated to be needed for their peak demand. **Table 4.2** shows how the proposed parking supply and estimated

demand compare for the MVHS IHC development. Based on this analysis, the hospital could consider allocating some hospital employees to the parking lot adjacent to the medical office building to more equally distribute demand amongst the MVHS IHC facilities.

Table 4.2—Parking Summary

	Proposed Supply	Anticipated Peak Demand	Estimated Surplus
Hospital	1,455	1,440	15
Medical Office Building	375	283	92
Total	1,830	1,723	107

Parking generation information is included in **Appendix E**.

4.3 Trip Generation

The 10th Edition of ITE’s Trip Generation Manual was used to estimate the traffic that will be generated by the proposed development during the typical weekday AM and PM peak hours. Using the same land use codes and variables (hospital employees and SF of medical office building), the trip generation for the proposed project is shown below:

Table 4.3—Trip Generation

ITE Land Use Code	Description	Unit	AM Peak Hour			PM Peak Hour		
			Entering	Exiting	Total	Entering	Exiting	Total
610	Hospital	Employees	476	176	652	185	500	685
720	Medical- Dental Office	GFA (kSF) ¹	143	40	183	76	197	273
Totals			619	216	835	261	697	958

1: GFA – gross floor area, kSF – thousands of square feet

The proposed project includes the acquisition of a number of parcels within the study area. These properties currently, or have in the recent past, generate traffic in the study area that will be removed when the properties are acquired. To be conservative, and since detailed information regarding all of the uses is not available, the current traffic associated with these properties is not credited in this analysis.

Trip generation information is included in **Appendix E**.

4.4 Trip Distribution

As part of the analysis included for the NYS Route 5S project, an initial trip generation and distribution for the proposed MVHS IHC project was developed to be incorporated in their future conditions modeling. A letter memo was developed by GTS Consulting in March 2016 that used initial development assumptions and data provided by the MVHS regarding employee and patient zip code information to determine peak hour regional distributions (see **Appendix E**). While the project information has changed since that memo was developed that significantly changes trip generation estimates, the employee and patient information and routing assumptions are still valid. Therefore, the regional distribution from that memo was used for this analysis. **Figure 4.2** shows the regional trip distribution to the study area.

The local distribution of project-generated trips within the study area is based on the most logical routing to/from the larger/busier highways and roadways to/from each individual parking facility access. The number of trips allocated to/from each parking location is based on the size of the facility and on the following assumptions:

- All hospital related trips are routed to/from the garage, employee parking lots, and the emergency department parking based on the regional distribution, proportion of number of spaces available at each facility (i.e., the garage would see the most trips, then the larger employee lot, the smaller employee lot, and the emergency department parking would have the least number of trips assigned to it), and the most direct route to/from each access point
- The trips generated by the medical office building are directed to/from the parking lot adjacent to the building

The future AM and PM peak hour trips associated with the proposed development are shown in **Figures 4.3 and 4.4**, respectively.

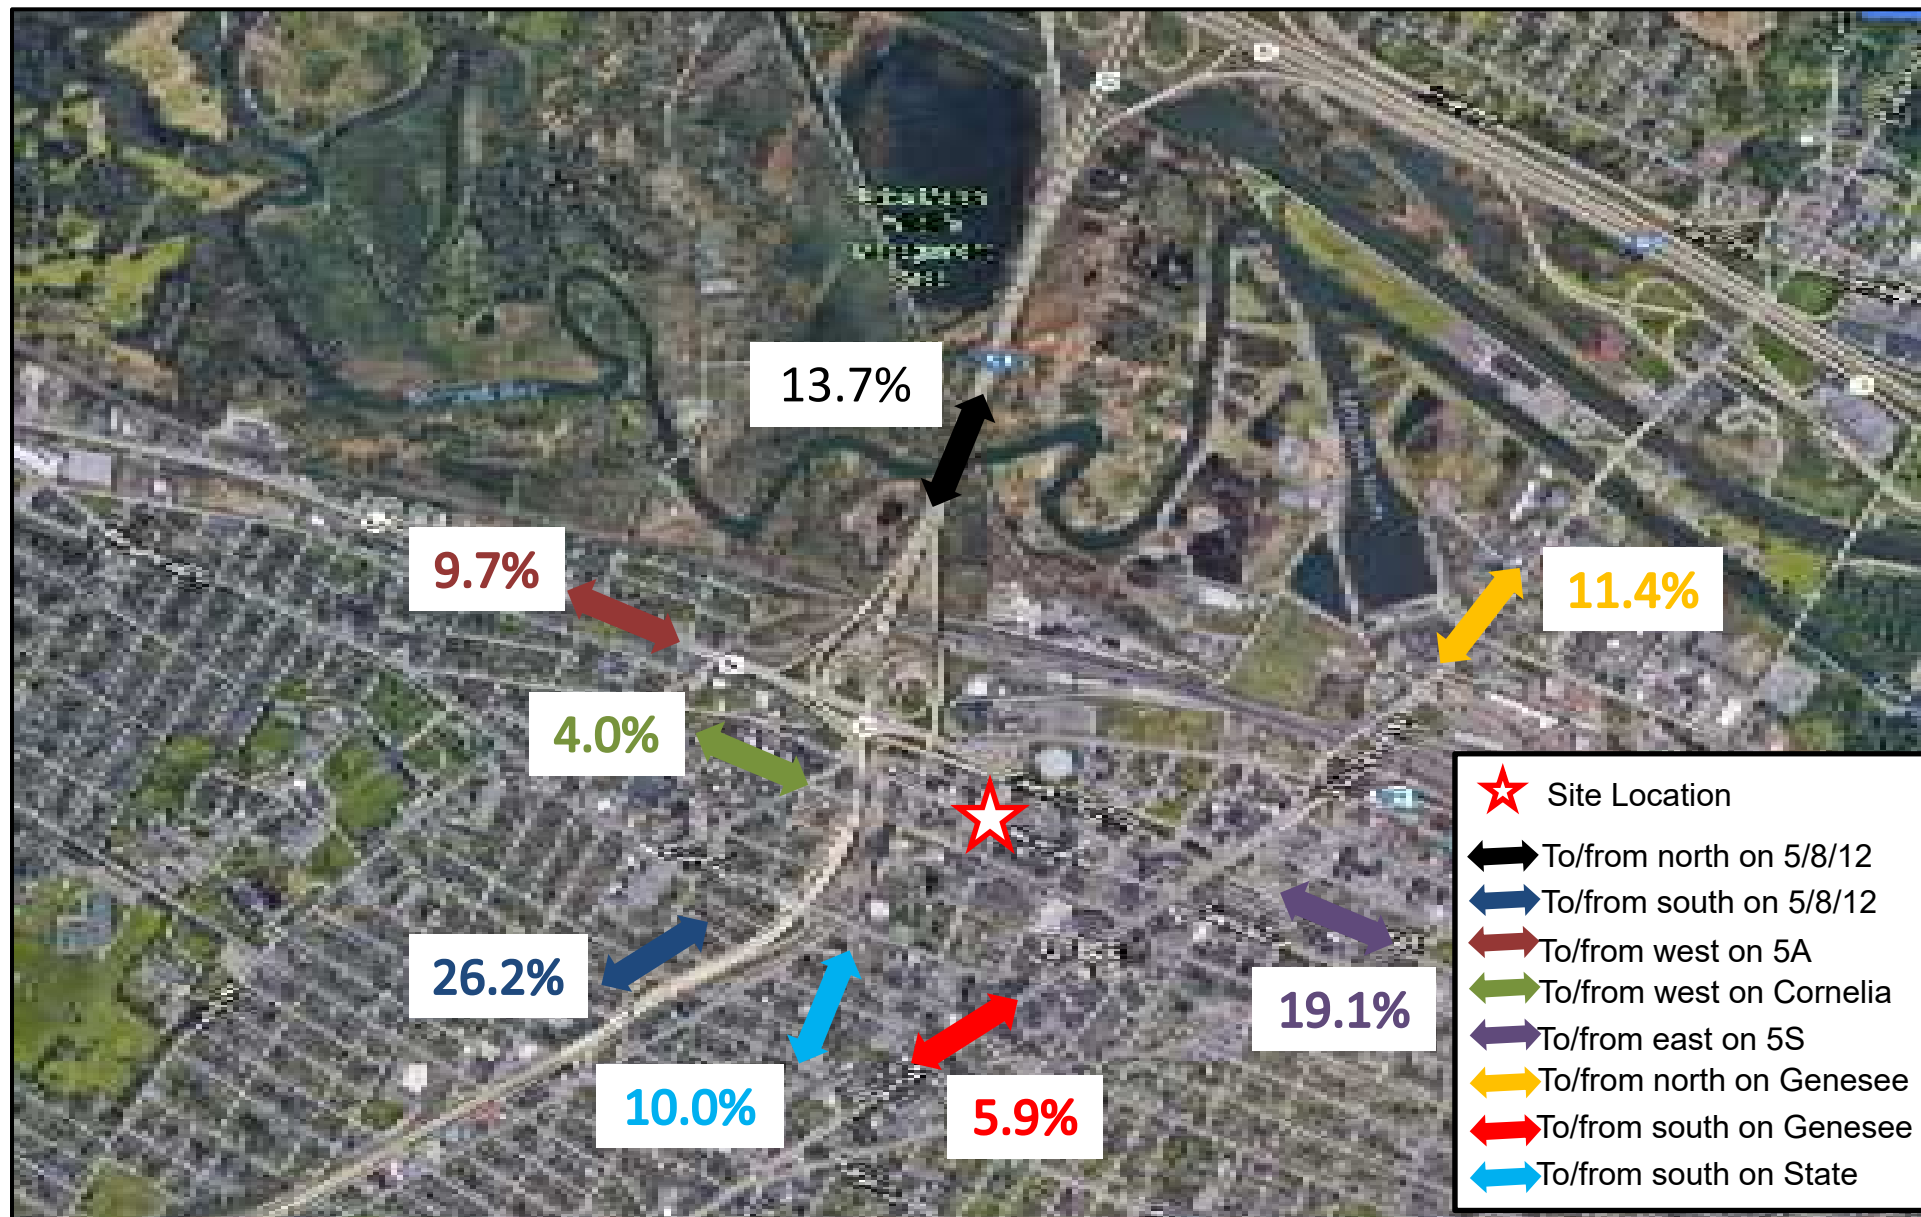

4.5 Future Build Volumes

The estimated AM and PM trips generated by the proposed project were added to the future no-build volumes (see Figure 3.1) to create the future build conditions volumes. The future build condition volumes also incorporate any traffic rerouting/redistribution based on anticipated road closures associated with the proposed development. This rerouting/redistribution throughout the study area intersections was based on assumed traffic patterns.

The future build condition volumes for the AM and PM peak hours are shown in **Figure 4.5**.

4.6 Future Build Analysis

A capacity analysis was performed for the study area using the future build condition traffic volumes. Starting on page 4-19, **Tables 4.4 and 4.5** shows the AM and PM peak hour future condition level of service (LOS), delay in seconds, volume to capacity ratio, and 95th percentile queues⁴ for each lane group of each study intersection.

When compared to the future no-build scenario analysis results, all of the study intersections operate at LOS C or better except for intersection 3 – State Street & Lafayette Street/Emergency Department Access (average intersection LOS F (85.6 sec) previously LOS D (43.8 sec)) and 6 – Cornelia Street & Oriskany Street (average intersection LOS D (42.4 sec) previously LOS C (21.8 sec)), both during the PM peak hour.

The following movements are expected to operate at a LOS E or F:

- 3 – State Street & Lafayette Street/ED Access (PM)
 - Northbound THRU/RT = LOS F (101.4 sec) previously LOS F (84.1 sec) when Lafayette Street continued eastbound through State Street
 - Southbound THRU/RT = LOS F (91.9 sec) previously LOS B (19.5 sec)
- 5 – State Street & Court Street (PM)
 - Northbound LT = LOS E (63.9 sec) previously LOS C (22.1 sec)
- 6 – Cornelia Street & Oriskany Street (AM)
 - Northbound LT/THRU/RT = LOS E (72.2) previously LOS D (53.4 sec)
- 6 – Cornelia Street & Oriskany Street (PM)
 - Northbound LT/THRU/RT = LOS F (176.3) previously LOS E (63.9 sec)
- 10 – Broadway & Oriskany/Liberty Street (AM)
 - Southbound LT = LOS E (55.9 sec) previously D (52.7 sec)
- 20/21 – Oriskany Street & Genesee Street (PM)
 - Northbound THRU = LOS E (74.1 sec) previously D (52.8 sec)

There is expected to be some delay during the PM peak hour for vehicles exiting the new parking garage onto State Street (LOS F (79.2 sec)). It is not anticipated that this delay, internal to the garage, will impact operations of the adjacent roadways.

The future build condition model reports are included in **Appendix B**.

⁴ “The **95th-percentile queue** is defined to be the queue length that has only a 5% probability of being exceeded during the analysis time period. It is a useful parameter for determining the appropriate length of turn pockets, but it is not typical of what an average driver would experience.”

https://www.hcmguide.com/Case1/popup_terms/95_percentile_queue.htm

- n/a - no conflicting movement, therefore no delays
- m - volume for 95th % queue is metered by upstream signal
- # - 95th % volume exceeds capacity, queue may be longer

4.7 Mitigation

Additional modeling scenarios were developed to determine what mitigation measures would be required to improve operations to future no-build scenario operations or better. The focus of this analysis was on the intersections that are expected to operate at an average intersection LOS D or worse and those intersections that have a movement at a LOS E or F.

There will be no recommended changes to mitigate the LOS F with 79.2 seconds of delay expected for traffic exiting the garage during the PM peak hour. It is assumed that these delays (only noted during the PM peak hour) will not warrant a signal at the intersection of State Street and the garage/proposed employee parking lot. As stated previously, it is not anticipated that this delay, internal to the garage, will impact operations of the adjacent roadways.

For the other intersections/movements, signal timing changes improve the individual movements from a LOS E or F to an acceptable LOS. **Table 4.6 and 4.7** show the future no-build, build, and mitigation scenario analysis results for the AM and PM peak hours of the intersections noted with decreased LOS in Section 4.6.

The delays during the PM peak hour at intersection 6 – Cornelia Street and Oriskany Street cannot be completely mitigated with signal timing changes, but the delays of the most impacted movements are lessened. The installation of a left turn lane was considered, but did not provide a significant improvement to the LOS compared to the anticipated costs and impacts to the soon to be reconstructed Oriskany Street (NYS Route 5S). The intersection is expected to operate overall at a LOS C during the AM peak hour and at a LOS D during the PM peak hour. Since the proposed development reconfigures the portion of Cornelia Street between Lafayette Street and Oriskany Street mainly as a hospital access roadway, it is not anticipated that the general public will use this roadway as a route to Oriskany Street or NYS 5/8/12. Therefore, similar to the delays noted at the garage exit onto State Street, the delays for the northbound movement of Cornelia Street at Oriskany Street are not expected to impact operations of the adjacent roadway network.

Section 5—Recommendations and Conclusions

This traffic impact study evaluates the potential transportation impacts to the adjacent transportation system from the proposed MVHS IHC development. The analysis included an evaluation of existing conditions, future no-build conditions, future build conditions, and the development of recommendations to mitigate adverse impacts to study area intersection operations. Based on these analyses, it was determined that the proposed development will not have a significant adverse impact on the adjacent transportation network with the following mitigation measures implemented beyond what is expected as part of the development plan for the project:

- Ensure adequate pedestrian facilities are available from each proposed parking area to the access points of the main hospital building
- Optimize signal timings at the following intersections:
 - 3 – State Street & Lafayette Street/Emergency Department Access (PM)
 - 5 – State Street & Court Street (PM)
 - 6 – Cornelia Street & Oriskany Street (AM & PM)
 - 10 – Broadway & Oriskany/Liberty Street (AM)
 - 20/21 – Oriskany Street & Genesee Street (PM)

The study also evaluated the proposed parking included in the development plan and compared it to anticipated peak period demands. Based on this evaluation, the proposed development plan provides adequate parking for its patients, staff, and visitors.

Intersection Summary

Area Type:	Other
Cycle Length:	55
Actuated Cycle Length:	55
Offset:	1 (2%), Referenced to phase 2:NBT and 6:SBTL, Start of Yellow
Natural Cycle:	45
Control Type:	Pretimed
Maximum v/c Ratio:	0.23
Intersection Signal Delay:	8.9
Intersection Capacity Utilization:	27.8%
Analysis Period (min):	15
Intersection LOS:	A
ICU Level of Service:	A
